PicoVNA® 100 Series

6 GHz and 8.5 GHz vector network analyzers

Groundbreaking PicoVNA 5 software now available!

See inside...
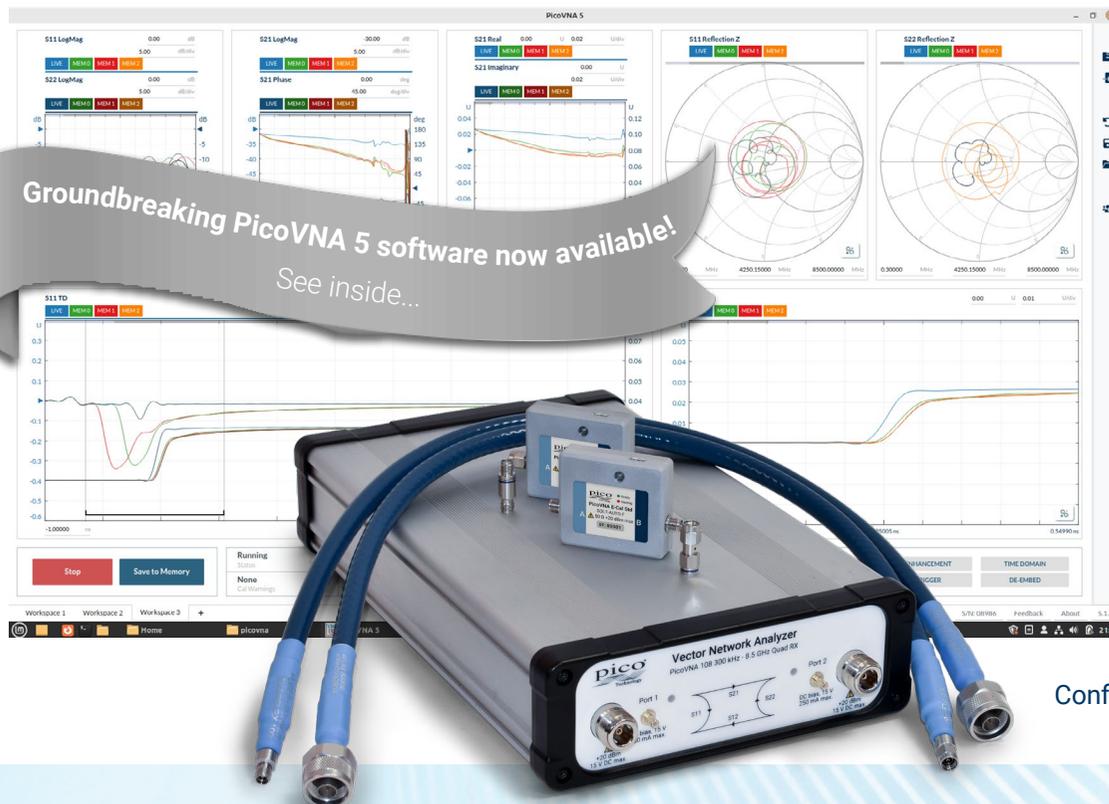

Professional and portable performance at low cost

300 kHz to 6 or 8.5 GHz operation

High speed, up to 5500 dual-port S-parameters per second

$> 10\,000\ S_{11} + S_{21}$ per second

Quad RX four-receiver architecture for best accuracy

Up to 124 dB dynamic range at 10 Hz bandwidth

0.005 dB RMS trace noise at maximum bandwidth of 140 kHz

Half-rack, small-footprint, lightweight package

Reference plane offsetting and de-embedding

Time domain and port impedance transformations

Multiple live and memory traces on dual y-axis display channels

Save on trigger for high-speed device profiling (PicoVNA 108)

Dual-frequency mixer measurements with VSWR correction (PicoVNA 108)

Phase meter, P1dB, AM to PM, and stand-alone signal generator utilities

Male and female SOLT and automated E-Cal calibration standards

Guided 8/12-term, SOLT, TRL and TRM calibrations including unknown-through

Confident measurement based on traceable data for all calibration and check standards

www.picotech.com

Vector network analysis for the many

Once the domain of an elite few, microwave measurement has encroached into the lives of scientists, educators, surveyors, inspectors, engineers and technicians alike. Today's microwave measurements need to be straightforward, portable, accurate, cost-effective, easy to learn and as fast and automated as possible.

PicoVNAs are all-new, UK-designed, professional USB-controlled, laboratory grade vector network instruments of unprecedented performance, portability and value for money. Despite their simple outline, small footprint and low cost, the instruments boast a four-receiver architecture to minimize the uncorrectable errors, delays and unreliability of internal transfer switches.

The PicoVNA 108 delivers an exceptional dynamic range of 124 dB at 10 Hz (118 dB for the PicoVNA 106) and less than 0.006 dB RMS trace noise at its maximum operating bandwidth of 140 kHz. The instruments can also gather all four S-parameters at each frequency point in just 182 µs (PicoVNA 106) or 189 µs (PicoVNA 108), or S_{11} + S_{21} in less than 100 µs. In other words, a 201 point 2-port .s2p Touchstone file in less than 38 ms or up to two .s1p files in less than 20 ms. Their low price makes them cost-effective as deep dynamic range scalar network analyzers or single-port vector reflectometers as well as full-function dual-port, dual-path vector network analyzers. They are affordable in the classroom, in small businesses and even in amateur workshops, yet capable of meeting the needs of all users up to the laboratory or production test technician or the metrology expert.

Metrology and working standard accessories

6 GHz and 8.5 GHz models
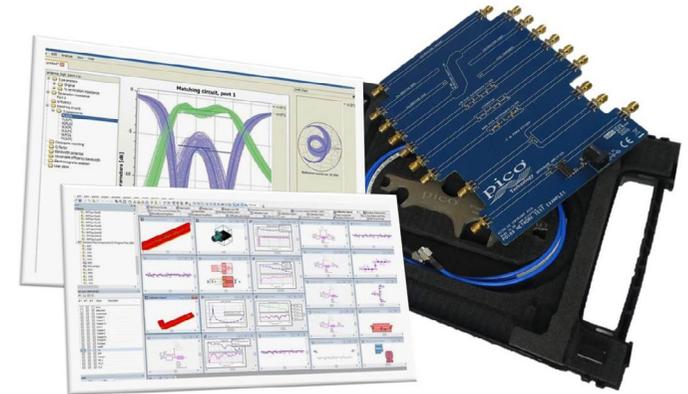

Teaching aids and CAD integrations

Multiple-unit remote control

Vector Network Analysis in the field, the work place or as embedded function

The PicoVNAs' small size, light weight and low cost suit them to field service, installation test, embedded and classroom applications. With their remote automation capability, they are also attractive in applications such as:

- Test automation, including multiple VNA control and measurement
- Manufacturers needing to integrate a reflectometry or transmission measurement core
- Inspection, test, characterization and calibration in the manufacture, distribution and service center industries
  - Electronics component, assembly and systems, and interface/interconnect ATE (cable, PCB and wireless)
  - Material, geological, life science and food sciences; tissue imaging; penetrating scan and radar
- Broadband cable and harness test and matching at manufacture and installation, and fault-over-life monitoring
- Antenna matching and tuning

Software development kits, including code examples in MATLAB and MATLAB RF toolbox, LabVIEW, C, C# and Python, are all available for download from Pico Technology's GitHub pages. Examples include multiple instrument addressing and control.

PicoVNA® 100 Series vector network analyzers

Quad RX four-receiver, single-sweep, architecture

The PicoVNAs integrate a fast-stepping sine-wave signal source with a very fast-settling port transfer switch. Faster than dual-sweep competitor VNAs, within a single frequency sweep, at each frequency point, the PicoVNAs stimulate both ports in turn and twice measure phase and amplitude of incident, reflected and transmitted waves at the four receivers. This could be achieved with a degree of accuracy with a single source, a transfer switch and two receivers; the latter inputs being switched through a further pair of transfer switches. Alternatively, three receivers can be used with an additional input transfer switch. The PicoVNA, however, uses four receivers. This eliminates the receiver input transfer switch errors (chiefly leakage and crosstalk) that cannot otherwise be corrected. These residual errors are always present in two- and three-receiver architectures and lead to lower accuracy than that of the *Quad RX* design.
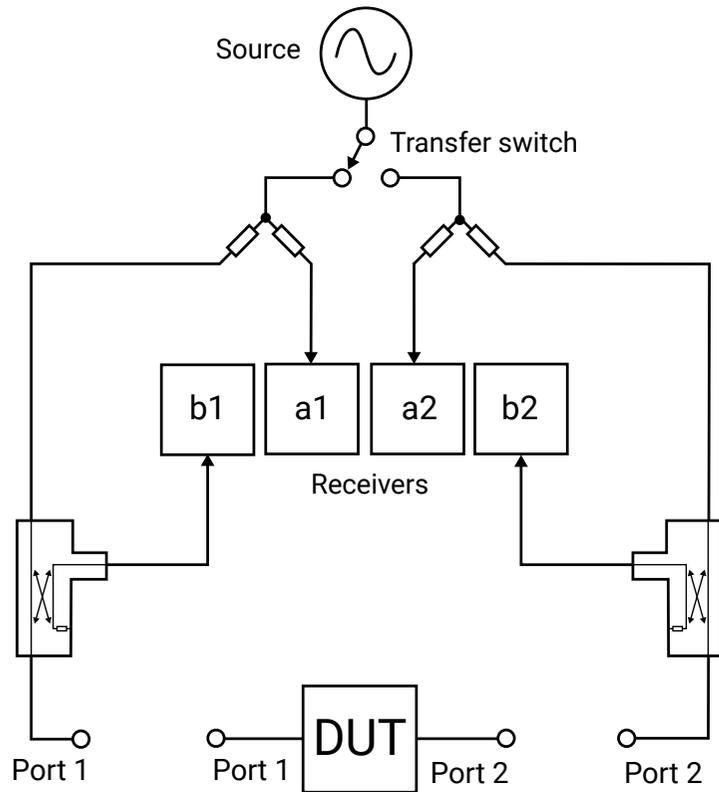

Support for 8 and 12-term calibration and the *unknown through*

Almost all vector network analyzers are calibrated for twelve error sources (six for each signal direction). This is the so-called *12-term calibration*, which experienced VNA users are used to performing fairly regularly. In a four-receiver design some error sources are so reduced that *8-term calibration* becomes possible, along with an important and efficient calibration technique known as the *unknown through*. This gives the ability to use any *through* interconnect (including the DUT) during the calibration process, vastly simplifying the procedure and reducing the number of calibration standards that need to be maintained. Advanced vector network analyzer users will be pleased to know that internal a-wave and b-wave data can be exported for diagnostic use.

## SOLT (short, open, load and through) calibration

All vector network analyzers need to reference their measurements to well-known standard networks. These need to provide a wide dynamic range of amplitude and phase (or delay time) so that measurements between the given extremes become calibrated. PicoVNAs support SOLT calibration of transmission and reflection, whereby the short, open and through provide known and opposing extremes of phase, high-scale amplitude and transmit isolation. The load provides known low-scale reflect amplitude and transmit isolation. For Pico calibration standards these are all fully and traceably S-parameter characterized.

TRL and TRM (through, reflect, line and match) calibration

This is theoretically accurate because a machined air transmission line can be fabricated more precisely than a good match can be measured; certainly at higher frequencies. As this line standard can also carry the burden of time (phase) calibration, the additionally needed high-reflection standards, the shorts or opens, can also be less well known.

TRL technique requires a line length of significantly more than 0° phase delay and significantly less than 180°. Thus, a single TRL line can only address a limited frequency band. The PicoVNA 108 supports one or two TRL bands and can account for line impedance offset if required. A low-frequency TRM band can reference a readily fabricated resistive match.

TRL and TRM calibration are popular choices when measuring substrate-mounted DUTs, for example surface-mounted networks or components. The line, match and reflections (shorts and opens in the PicoVNA case) can all be readily fabricated on substrate and at precise on-substrate measurement reference planes.
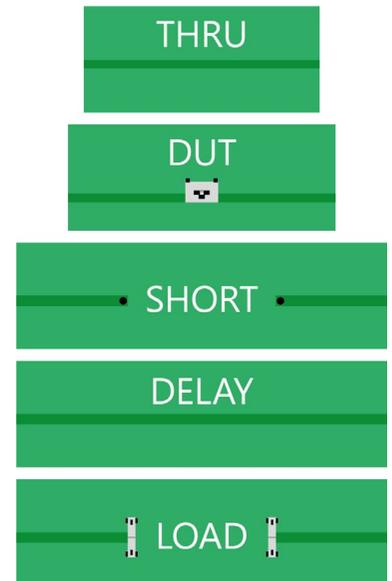

PicoVNA 5: Game-changing new software for PicoVNA

PicoVNA 5 brings a new, crisp, clean focus to results, status and graphical presentation, with minimal clutter over maximum display area. As a ground-up architecture, PicoVNA 5 is a thoroughly modern, 'platform' control software for the PicoVNA vector network analysers. Designed on a Linux toolset, it is cross-platform, light footprint, and will run at speed on Linux, Windows and macOS (Intel/ARM); hosted on any device, down to a Raspberry Pi 3 and using locally or network connected keyboards, mice, monitors and touch-screens.
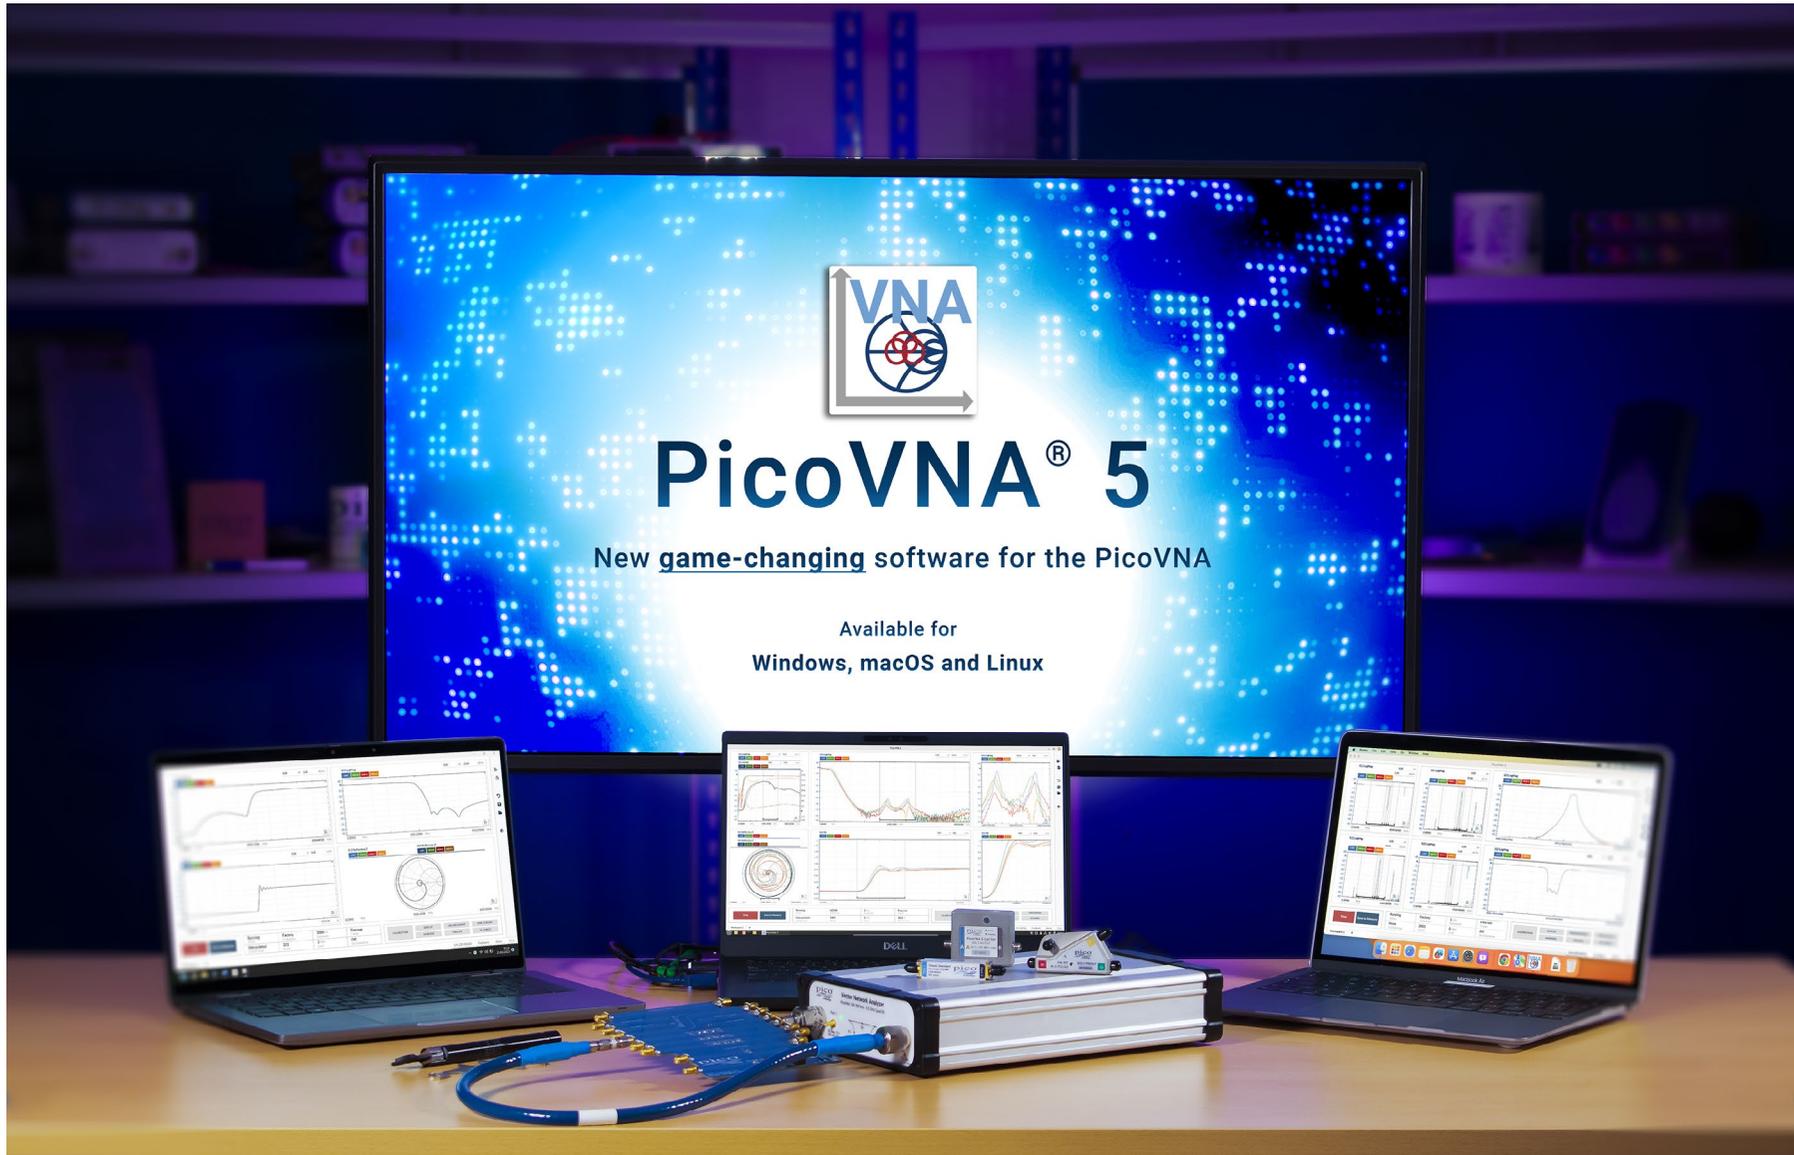

PicoVNA 5: Game-changing new software for PicoVNA - Intuitive, and direct menu-lite interface

Plotted parameters, sensitivities, offsets, reference positions and sweep or time-domain parameters and plot type (e.g. cartesian, Smith or polar; logarithmic, linear, delay or angle) are all directly editable within each displayed plot channel. There are helpful on-trace cursor readouts under mouse, hover, or touch and you can simply click to drop on a trace marker and then drag it to the feature or position that you need. Most of your frequent instrument operations fully covered without a need to find an off-plot menu!

S11 plotted on dual-axis. **LogMag** with offset and sensitivity controls.

VSWR with offset and sensitivity controls.

Show/hide/bring to front traces on each axis

Show/hide marker readouts

Axis Reference: Triangular indicators are draggable.

Data controls:
Export Data
Import Data
Reset to factory defaults
Save Session
Load Session
User Preferences

Marker readouts: Grouped and individually configured for main, auxiliary and delta readouts

Sweep/span or timebase controls

Format view:
Add axis
Zoom region
Magnify
Maximize graph

Workspace tabs: Independent set-ups, views, spans and calibrations.

Start/Stop and **Save to Memory** controls.

Status grid with pop-up controls.

Calibration: Mode selection: SOLT, TRL/TRM & E-Cal.

Main menus: Use these buttons to display main menus.

Expansions: Hardware, software, firmware and user feedback options.

PicoVNA® 100 Series vector network analyzers

PicoVNA 5: Game-changing new software for PicoVNA

How many views or traces do you need?

Store and display snapshot memory traces across all the plots with a single key press and single-click hide/show toggle them within each viewport, or across all plots via the **Display** menu. You can add a second cartesian axis to your plot, segment zoom or magnify your trace (including Smith and Polar plots), or maximise your plot area; all via the format

button at the lower right of each plot:

Choose a viewport layout from standard multi-port layout templates or use PicoVNA 5's innovative drag-and-snap viewport grid to add and re-shape as many individually sized and positioned plots as you wish. At any display size and resolution, you can keep a user-configured eye on all the live and stored trace plots that you need. They can be an arbitrary mix of frequency and time domain views.
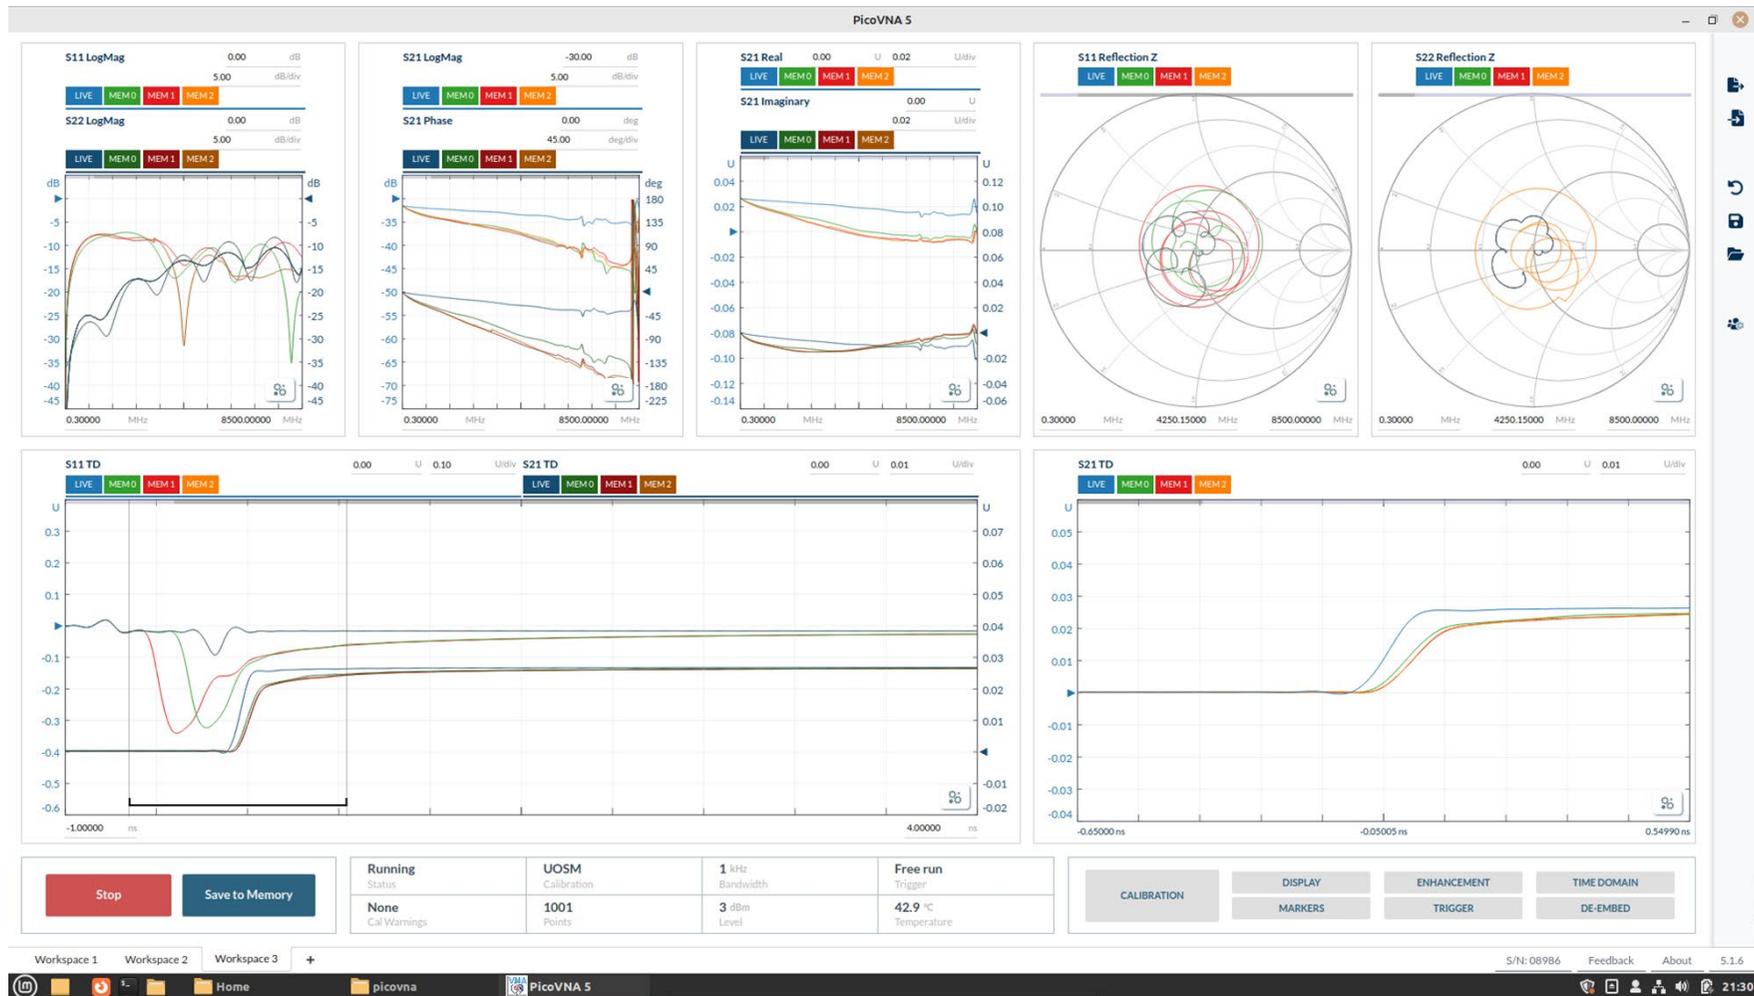

PicoVNA 5: Game-changing new software for PicoVNA

What measurement values does your application need to capture?

As each marker is dropped, its basic readout adds to a readout column to the right of the viewports. Simply click on one of those to edit the trace it is attached to, its position, convert it to a delta-reference marker, group it or trash it.

Alternatively, click its readout value to select many additional measurements that will be available for display under each marker. Also, similarly to the traces on each plot, you can hide/show toggle marker readouts to give focus to the view or screen grab of the moment.
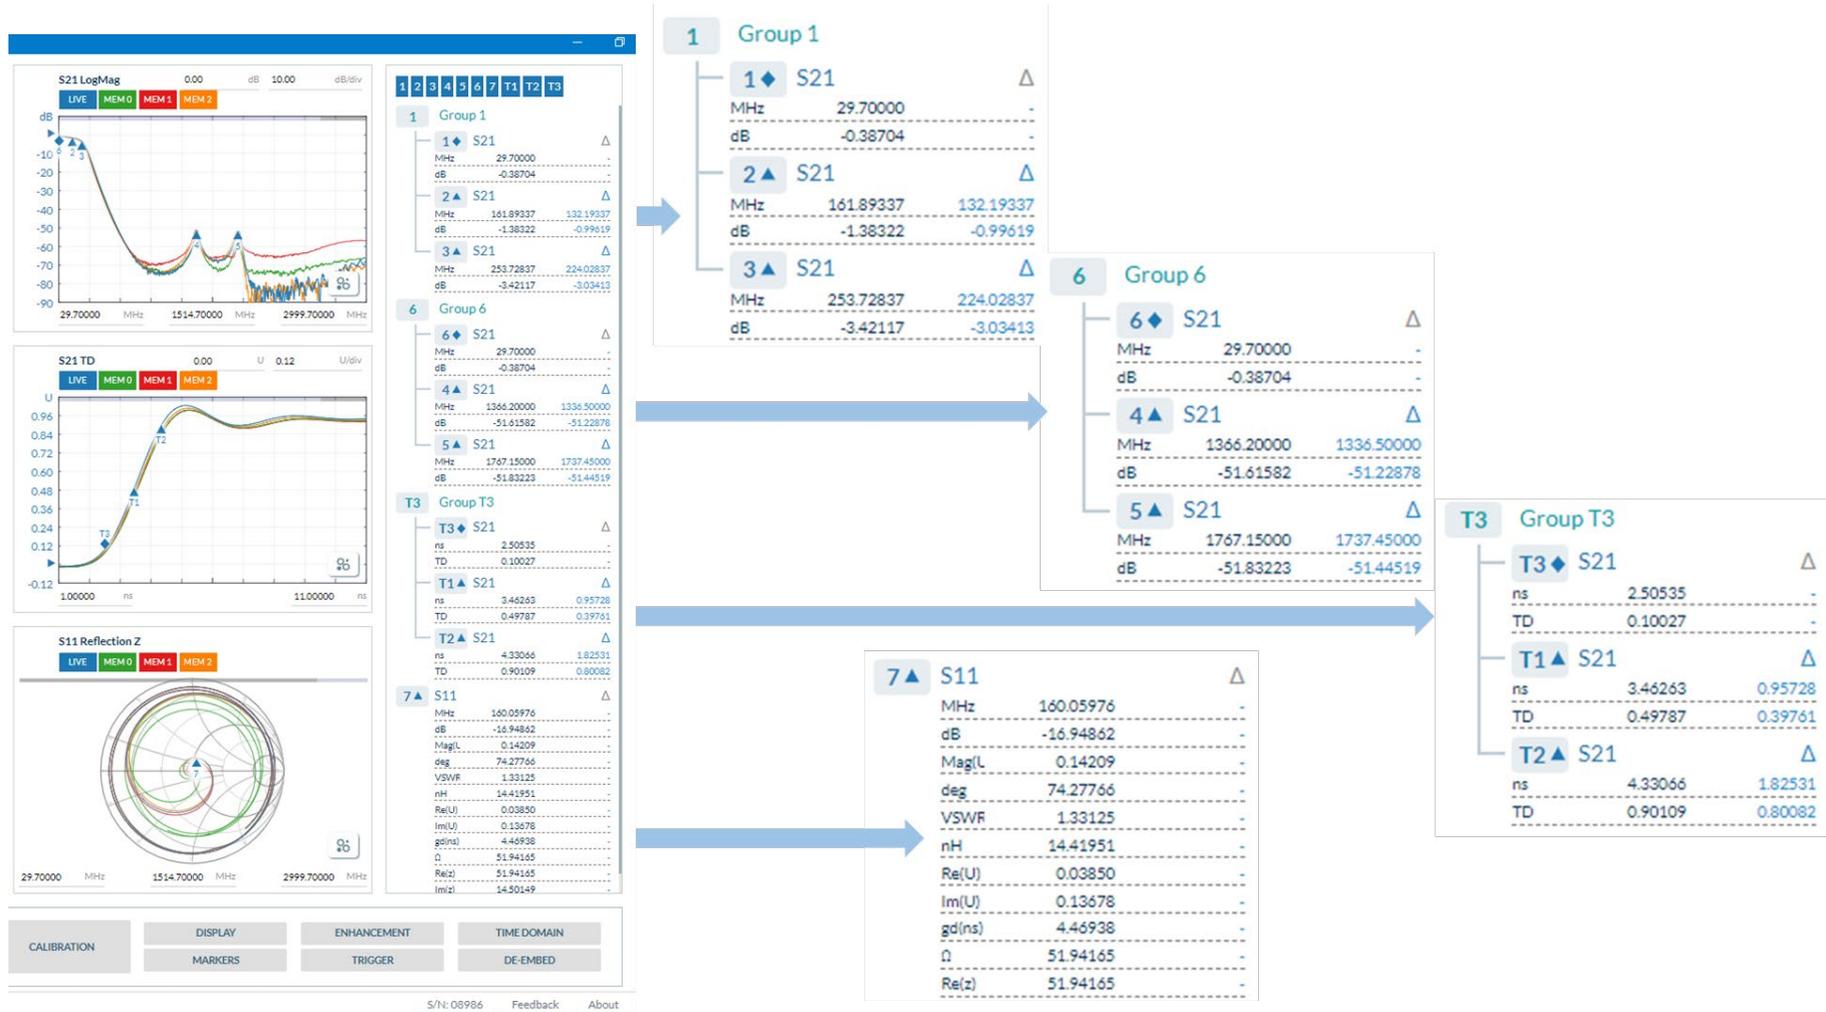

PicoVNA 5: Game-changing new software for PicoVNA

Multiple time-domain views

Live update time domain plots and measurements can be defined across any number of view ports and s-parameters. These can be configured as Lowpass or Bandpass with user defined DC termination (short, open, resistance or automatic). The user can select Step or Impulse response with or without windowing, and with readouts that are time or distance related.

On plot controls allow display of any time span within the support of the underlying sweep span and digital zoom is also available.
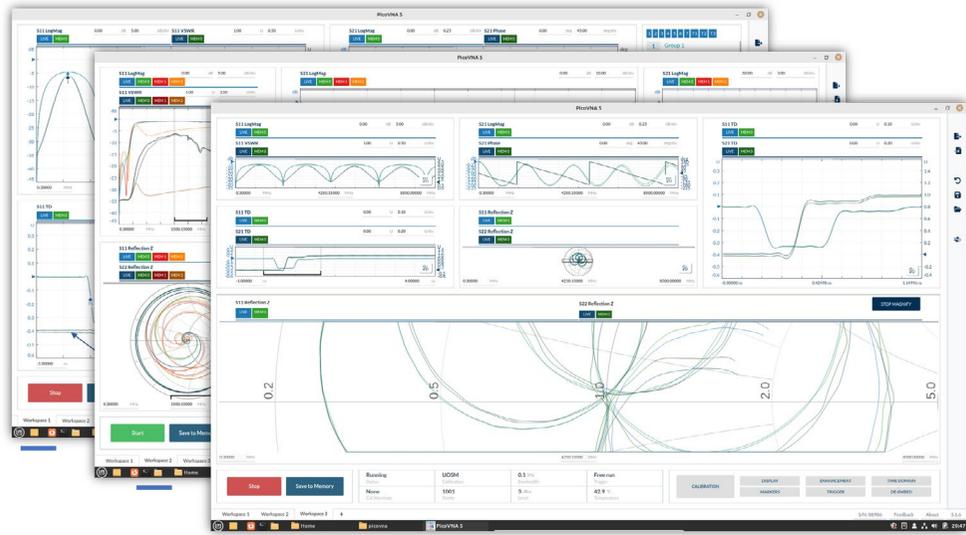

Independent workspaces

Unique to PicoVNA 5, the user can add and define multiple workspaces, each with their own user settings, spans, views, measurements and calibrations. This powerful feature allows instrument sharing across multiple users or applications, fast access to preset measurement set-ups (perhaps a sequenced procedure), preset demonstrations or rapid toggling of different perspectives on a given measurement.

Save/recall, export/import and user preferences

The PicoVNA 5 user can export uncalibrated data as raw a/b wave (.csv) or calibrated vector data as .csv or as MA, DB, RI Touchstone formats. Equally the user can import, display, process and measure as a memory dataset, TouchStone (V1/V2), saved from any VNA and sweep span. PicoVNA 5 supports this as on or off-line (no connected VNA) operation.

All instrument and UI settings can also be saved and the user can choose to reload as any combination of settings, calibration and s-parameter data.

PicoVNA® 100 Series vector network analyzers

PicoVNA 5: Game-changing new software for PicoVNA - Frequency or time segment zoom and magnify plot detail

There are two powerful results detail views implemented in PicoVNA 5 beneath each plot format key.
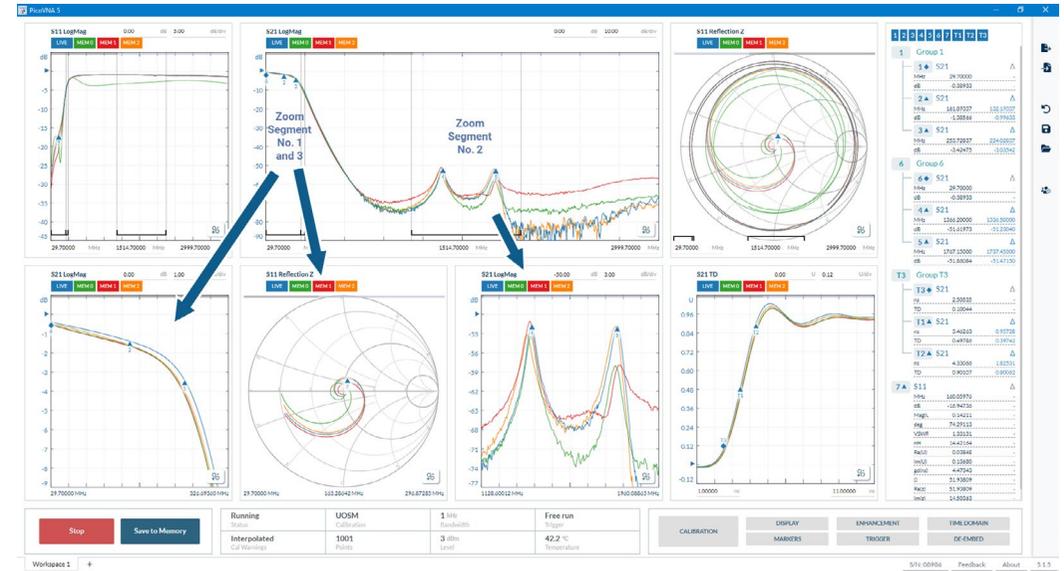

Magnify: adds a scroll wheel magnified view centered on any point within your plot. The current plots area divides horizontally or vertically to allow the live updating spy-glass plot. Now you get to see just how good your matches, shorts or opens really are at the center, the bounds or in fact anywhere on your Smith; or any other plot!

Zoom Frequency or Time Segments: each selection of this tool adds a user draggable frequency or time span to the span axis of your plot (including Smith and Polar). Once set, add a new zoomed segment plot to the drag'n'snap viewport grid. Repeat to add further zoomed segments and plots if you wish and then re-arrange your display layout to suit.

Both forms of added viewport fully support fine position cursor readouts and markers drop and drag. And by providing the two mechanisms PicoVNA 5 releases you from the confines of a single detail inspection mechanism!

User defined interpolations

An advanced provision, closely associated with Zoom and Magnify, the PicoVNA 5 user can set their Preference for interpolation mechanism on a per plot-type basis. Select rom several vector or scalar interpolations and apply them to real-imaginary or to magnitude-angle data. Usefully, this will apply for either Live, Memory or Imported data in on or off-line (no connected instrument) applications. Additionally the user can elect to export data with or without processing.

PicoVNA® 100 Series vector network analyzers

PicoVNA 5: Game-changing new software for PicoVNA

Multiple and fast remote access paths

At the forefront of PicoVNA 5 design we had the flexible-platform programmer and OEM embed/test system integrator in mind!

Via multiple access points, PicoVNA 5 supports both remote program command and retrieve (SCPI compliant) via the GUI and a separate advanced user API. Both paths are optimized for fast data transfer, for example into imaging/radar/dielectric analysis and test applications. They also present a familiar SCPI path for those needing to integrate or replace a VNA within a larger product, test system or remote location. Local and network remote UIs then sit on further access points, allowing a local and/ or remote operator to interact with a SCPI sourced test sequence. Network/internet mirrored training or support sessions can therefore be supported under the PicoVNA 5 UI.

Programmers can access a comprehensive set of SCPI and API SDK examples for MathWorks MATLAB, National Instruments Labview, Python, C, C# and C++ via our [GitHub organization page](#).

PicoVNA 5 remote command and retrieve benefits from punishing alpha and beta testing within advanced and demanding remote applications.

For PicoVNA 2/3 remote DLL users

PicoVNA 5 does not replicate the remote command and retrieve of the predecessor software and DLL of PicoVNA 3. We encourage migration to the new platform and the extended functionality of PicoVNA 5, via SCPI or the API. The above SDK examples and Pico Technology's Technical Support team will assist the migration when users are ready to do so. Meanwhile, PicoVNA 3 and its control DLL remain available and fully supported.

PicoVNA 5: Game-changing new software for PicoVNA

E-cal or fixed SOLT and TRL calibration

PicoVNA 5 software supports all of the PicoVNA calibration methods with an advanced and step-by-step diagrammatic calibration wizard. As an assurance of calibration quality for the fixed SOLT and TRL/TRM calibrations, each calibration measurement presents as a live pre-scaled display trace and completion of one stage, presents the next until all are complete. Users can elect to change or re-visit any stage of the sequence until it is complete.

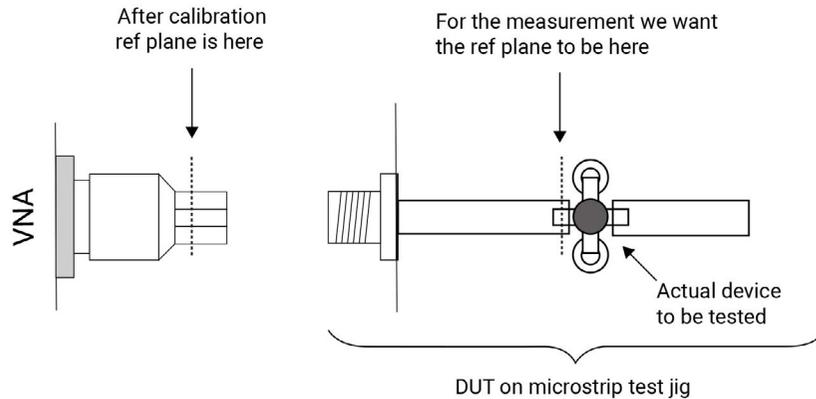

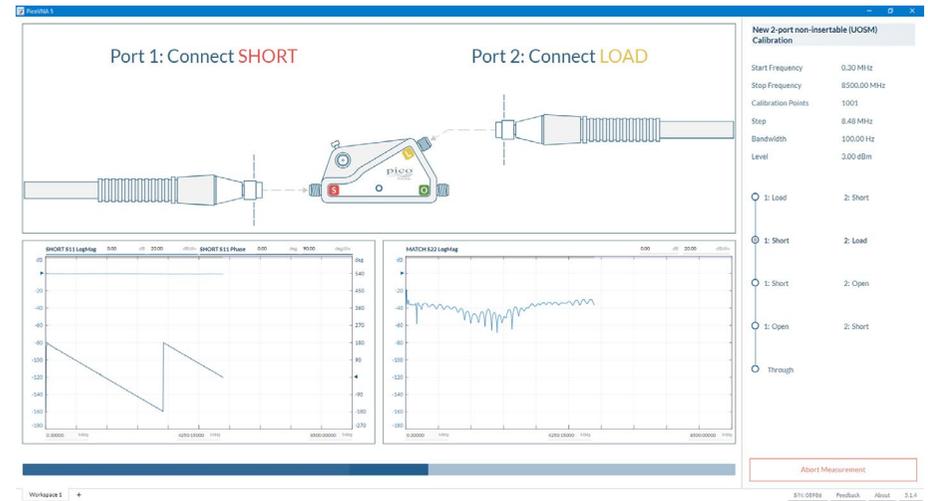

DUT on microstrip test jig

Reference plane extension

Reference plane extension (offset) allows you to shift the measurement reference plane away from the point established during calibration. This is useful in removing the path length of assumed ideal interconnecting , connectors cables or microstrip lines from measurements.

The PicoVNA 5 software allows independent reference plane extensions on each of the ports and these can be additional to de-embed (below).

De-embed port interfaces

When it is unsafe to assume the above ideal interconnecting connectors cables or microstrip lines; for example to achieve greater accuracy or to remove known imperfections in a test setup, we can choose instead to de-embed the interface networks on each measurement port. The PicoVNA 5 software simply requires a full Touchstone .s2p file or files for each of the embedded interfacing networks on the two ports. Unusual for some vector network analyzers, the PicoVNA software will competently vector interpolate between calibration frequencies and de-embed file frequencies where necessary and possible.

PicoVNA® 100 Series vector network analyzers
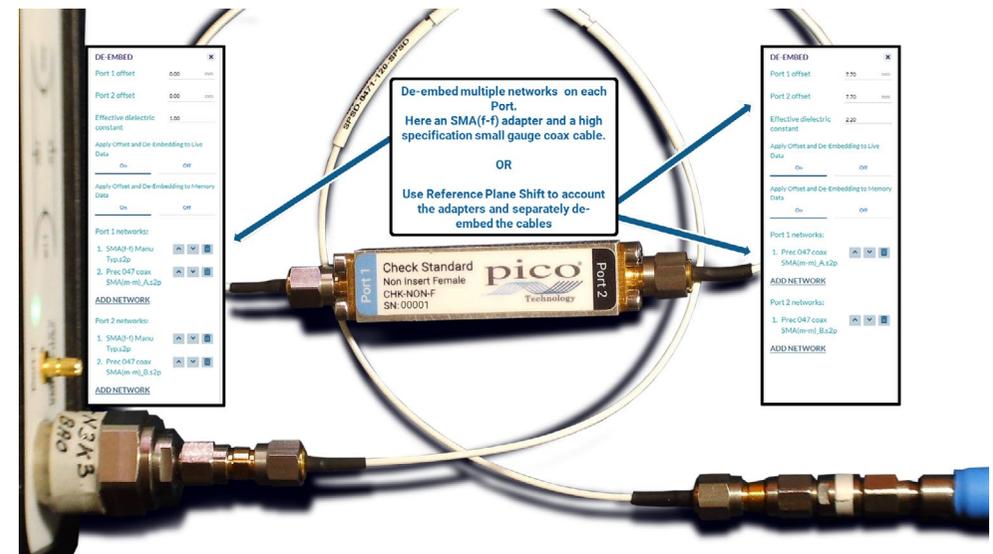

PicoVNA 5: Game-changing new software for PicoVNA

Start-up on/off-line connect options

PicoVNA 5 automatically scans for and connects a local USB connected instrument. Whilst it does so, opportunity to load files or connect a software emulated **Demo** device are presented to the user. These access mechanisms are for those wishing to view or evaluate PicoVNA 5 software, or for students or hybrid and hardware share employees needing to process files later and without a connected instrument. Networked or Internet remote instrument connections are also established from here.
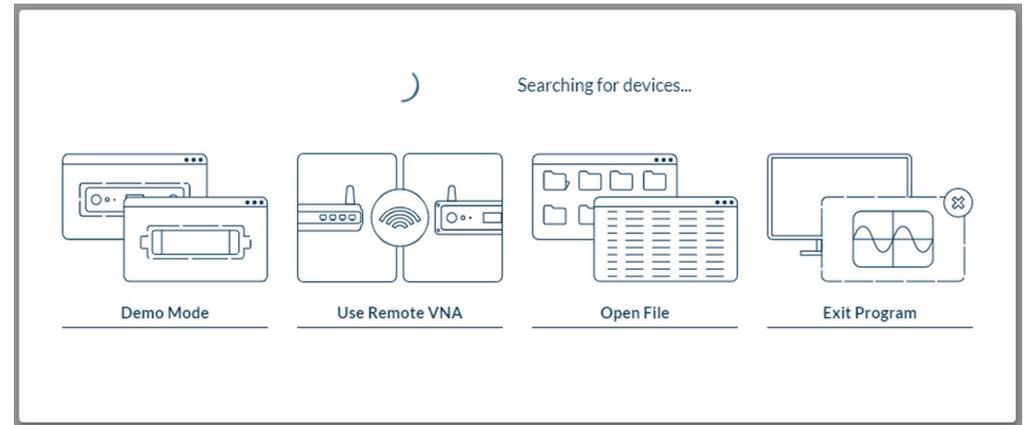

Existing PicoVNA instrument upgrade

The new PicoVNA 5 software unlocks and will continue to unlock new instrument communications and capabilities. Pre-existing instruments will therefore require an embedded software upgrade. The need to upgrade will be identified by the PicoVNA 5 application during the USB instrument connection process, and it will seamlessly handle the whole boot loader process.

A small charge of $359, €329, £279 is made for this upgrade via an in-application purchase. PicoVNA 5 and its instrument communication are developed in the UK by AAI Robotics Ltd., of Cambridge. This is a direct payment to AAI Robotics, made via the Stripe (www.stripe.com) global card or e-payments system.

On-going user-driven development

Guided by user and remote programmer feedback at every stage of the process, and using the latest Agile software development techniques, PicoVNA 5 is a ground-up, rapid-evolve architecture. The UK design consortium (Pico Technology, LA Techniques and AAI Robotics) have defined and implemented PicoVNA 5 first release to be a fully functional but foundational VNA feature set. We strongly believe that we will optimize our delivery of today's user benefits only by releasing this foundation and by gaining your in-use feedback. It is your priorities for further development that should then drive us; whether that be for new features, feature enhancements or full functional parity with its predecessor PicoVNA 3 software.

To help reset or shape our understanding of your needs, please find at the bottom right of the PicoVNA 5 user interface, the new **Feedback** tab. This has been included to conveniently capture your in-the-moment commentary on the software. There is also a tool in which you can quickly compile your priority for the ongoing development program, and make email or instant-messenger contact with the design team.

The PicoVNA 3 software and GUI interfaces with the VNA over USB 2.0 and displays or exports measurement results. MS Windows display, in default or dark theme, presents up to four user configurable plot channels, with dual y-axis cartesian, polar or Smith plots, each supporting up to four live and four memory traces and eight measurement markers. Marker results are tabulated to the right and summarized below each plot to give at-a-glance understanding of the networks under test. Y-axis reference, scalings and offset are click and drag or type editable.
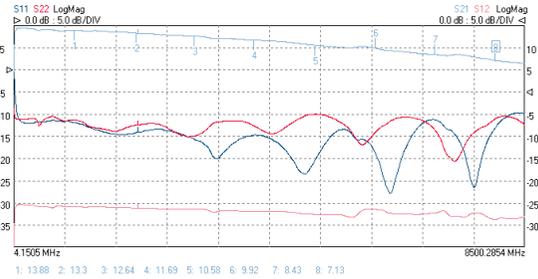

Show all S-parameters separately or combine on a single plot.

Configure as one, two or four channels and show one to four live traces on each. Add one to four memory traces to each.

Plot both reflection parameters (S_{11}, S_{22}) as LogMag and Phase.

Gain and phase can be combined in one plot, but with up to four live traces, why not plot forward and reverse match and phase or gain and phase together, as above?

Show S_{11} and S_{22} on the same Smith chart.

Add up to four memory traces if required.
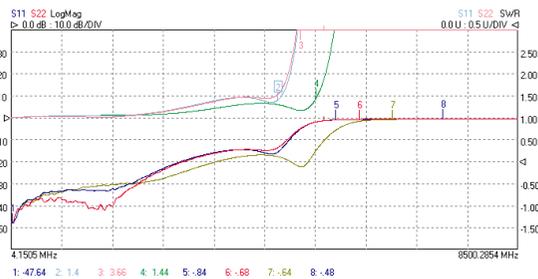

Plot both reflection parameters (S_{11}, S_{22}) as LogMag and SWR.

Two of four memory traces in use to compare another DUT.
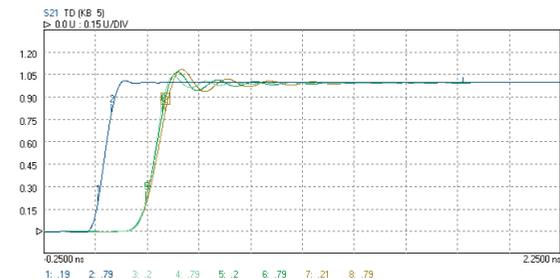

Compare network pulse responses using S_{21} time domain.

Here using a live trace and up to four memory traces to compare low pass filter responses with through response.
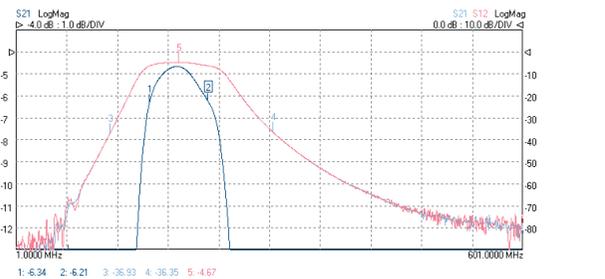

Display a single parameter at two sensitivities or offsets.

Here we see passband S_{21} flatness and S_{21}/S_{12} stopbands as live traces on the same plot.

PicoVNA® 100 Series vector network analyzers

Full instrument functionality using PicoVNA 3 software

PicoVNA 3 software presents VNA measurement and calibration simply, intuitively and with efficient usage at its heart. The software offers a comprehensive range of measurements and multiple trace, dual-axis plot formats in one, two or four user-configurable display channels. All the standard vector network analyzer functions and tabulated measurements can be seen at a glance.

Import/export, help and utilities
Save, recall, print, labels and calibration tools

Illustrated use of display channels and Y-axes
1. Two live update parameters (S_{11} and S_{22}), plotted log magnitude (left axis) and SWR (right axis
2. One live parameter (S_{21}), plotted Log Magnitude at 0.5 dB/div (left axis), and 0.05 dB/div and -2.0 dB offset (right axis)
3. One live parameter (S_{11}), plotted Time Domain (impedance by time or distance)
4. Two live parameters (S_{11} and S_{22}), plotted as Smith Chart

PicoVNA 5/PicoVNA 3 feature comparison

PicoVNA 5 software will be preferred by most users. There will however be a brief period for which certain PicoVNA features are not yet addressed in the new software. PicoVNA 3 software therefore remains available and fully supported. The table below gives full detail comparison of features between the two softwares.

PicoVNA feature	PicoVNA 5 current release	PicoVNA 3
Operating system, platform and display		
Supported operating systems	Linux, Windows 7+, macOS 11 (Big Sur)+ Linux test distributions Debian 8 (Jessie) , Ubuntu 18.04 (LTS), Mint Cinnamon (Vera), openSUSE Leap 15.0, Fedora 28, Arch Linux. No problems anticipated on other distributions.	Windows only
Supported controllers	PC, Mac (Intel/Arm), Linux AArchh64 onwards, Pi 3 onwards 64 bit	PC only
Supported display resolution	All	Limited rescaling to monitor aspect and resolution
Development environment	Generic, foundational and ground-up design. Built for speed, scalability and cross-platform compatibility. Maintains compatibility with older computer hardware while making efficient use of modern hardware to unlock new data processing possibilities. Designed to be capable of rapid expansion to meet ever evolving user requirements.	Legacy MSWindows design environment and toolset, limited scope and design efficiency to rapidly meet ever increasing user needs.
Measurement viewports (channels)		
Live traces per viewport (plot channel)	2	4
Dual-axis plots	Yes	
Memory traces per viewport (plot channel)	Unlimited*	4
Number of viewports (plot channels)	1 to unlimited*	1, 2 or 4
No. of live time domain viewports (plot channels)	Unlimited* (from any span setting)	1 (requires 2n measurement points)
User scaling and positioning of plots	Drag position and shape with snap to infinite grid	No, three built in layouts only
Plot variants		
Plot types		Cartesian (Time and Frequency), Polar, Smith
Plot formats		Log Mag, Lin Mag, Phase, Re, Im, Group Delay, VSWR, TD
Plot interpolations	User prefered linear, Cubic Spline or Akima Spline applied to Mag/Angle or Re/Im	Linear dot join on frequency domain plots, cubic spline on TD plots
Time domain variants	Low pass (step/impulse) and band pass (impulse) with Hanning, Rectangular and Kaiser Bessel windowing and Auto/Manual DC termination	Low Pass with Hanning, rectangular and Kaiser Bessel windowing and Auto/Manual DC termination

## PicoVNA 5/PicoVNA 3 feature comparison (continued)

PicoVNA feature	PicoVNA 5 current release	PicoVNA 3
In viewport (channel) controls and readouts		
On plot parameter edit	Span (time or frequency), plot parameter/type/format, sensitivity, offset, ref position	Sensitivity, offset, ref position
Hover on plot cursor readout	Yes, all traces	No
Click to drop and drag marker	Yes, all traces	No (menu apply + drag)
Markers count	Unlimited independent or grouped to reference. Note: readout display area scrolls	1 - 8 repeat across all plots and frequency locked together
Reference markers	Unlimited	1
Auto markers	Not in current release. bandwidth, Q, peak search auto markers to follow.	Search ±3dB and ±6dB
Multiple and delta readouts	Yes user configurable per marker or group	Yes, plot format dependent
Auto scaling of plot axis	Not in current release	Yes within Display menu
Magnify, zoom and processing features		
Zoom multiple span segments	Yes, define frequency or time segments for a new display port. Multiple segments per plot supported. Supports cursor readout and fine marker drop and drag	No
Magnify region of any plot	Yes, choose to magnify any region of any plot. Includes any focal point on Smith chart for example. Supports cursor readout and fine marker drop and drag	No
Trace averaging, smoothing and peak hold	Yes, averaging (unlimited), smoothing 0-10%. Peak/trough hold to come.	Yes, averaging 1-255, smoothing 0-10% and peak/trough hold
Trace vector maths	Not in current release	Yes, vector math, live + memo, live - memo, live/memo
Interpolated re-sampling and re-format Touchstone	Yes, reformat Touchstone as MA, DB, RI. Re-sample and more to come.	No
User workspaces		
Multiple independent workspaces	Yes, unlimited. Independent settings, spans, displays, calibrations, de-embeds, preferences	No
Calibration features		
Supported calibration methods		Fixed SOLT, TRL/TRM (single or dual Line) and E-Cal
Supported calibrations	S11, insertable and non-insertable, unknown Thru with/without enhanced isolation	S11, S21, S11+S21, insertable and non-insertable, known/unknown Thru with/without enhanced isolation
Graphical calibration assist wizard	Yes, with measurement plotting	No (text user prompts)

PicoVNA 5/PicoVNA 3 feature comparison (continued)

PicoVNA feature	PicoVNA 5 current release	PicoVNA 3
Supported cal kit definition	Pico.kit file, TouchStone, polynomial coefficients and TRL (1/2 frequency bands) and Open or Short Reflect. Includes in-app kits editor	Pico.kit file, TouchStone via external conversion to .kit, polynomial coefficients and TRL (1/2 frequency bands and Open or Short Reflect. Includes in-app kits editor
Import/export, save/recall and offline working		
Save/recall session	Yes, save all with selection at recall of calibration, settings, data.	Yes, save settings or calibration and settings
Import/export	Yes, .csv (comma or point separator), Touchstone V1/V2, MA,DB,RI, a-b wave.csv	Yes, .csv, Touchstone MA, a-b wave.csv
Standalone (off-line) operation	Yes; load, process, display, measure and re-save your data without instrument connection.	No
Save and Print display, viewport and readouts graphics	Not in current release - print screen or graphics grabbers available	Yes, plots + readouts with user print title labelling
Remote interfacing		
Remote control and retrieve	SCPI compliant GUI control and retrieve with Local - Remote operator inter-action. Plus separate high performance API.	Separate GUI-less DLL
Compatibile with PicoVNA 3 command set	No, PicoVNA 3 control.dll remains supported and there are comprehensive SDK examples to assist migration.	Yes
Network presence	Network present application that allows fully remoted command and retrieve, GUI operation and display mirroring.	No network remote support
Fixture or feed removal and Z_0 conversion		
Reference plane shift	Yes, manual in current release, independent on each port and can be combined with embe/de-embed networks as below	Yes, manual or automatic, independent on each port
Normalisation	No, not in current release.	Yes, either via trace math or loss at 1 GHz.
Embed/de-embed	Yes, de-embed separate Touchstone defined networks, one or multiple on each port, which can be applied in addition to Ref Plane Shift from above.	Yes, de-embed separate Touchstone defined networks, one on each port
System impedance adjust - Z_0 conversion	Not in current release	Yes, 10Ω to 200Ω, purely resistive and applicable to Live and Memory traces

PicoVNA 5/PicoVNA 3 feature comparison (continued)

PicoVNA feature	PicoVNA 5 current release	PicoVNA 3
Features yet to be migrated and enhanced**		
Limits editor and test	Not in current release. Significant enhancements envisaged.	Yes, upto six specified test limit bands with plot highlighted and audible fail.
Non-linear calibrations and measurements	Not in current release. Significant enhancements envisaged.	Includes P1dB and AM-PM measurement and plot utilities that include necessary calibrations
Save on trigger rapid characterisation	Not in current release	Included for PicoVNA 108, allows rapid multiple stepped parameter network/device characterisations based on hardware trigger
Offset frequency/mixer measurements (Conversion loss, port isolation, compression)	Not in current release	Yes (for PicoVNA 108), supports fixed or tracking external L.O. Includes direct USB remote control of tracking L.O. signal generator E.g. PicoSource AS108.
Absolute port power calibration	Not in current release	Yes, in the context of above mixer measurements. Includes direct control of external USB power sensors or other port receiver
Compare data with traceable uncertainties	Not in current release. Significant enhancements envisaged.	Includes tabular comparison utility with combined instrument and reference uncertainties
CW sweep mode	Not in current release	Yes, allows timebased trending of a single frequency measurement down to sub millisecond time increment
Phase meter mode	Not in current release	Yes, Phase Meter utility allows port receivers to lock to two external signals at a known frequency. The two are then compared for continuous measurement of their relative phase and amplitudes
Signal generator mode	Not in current release	Yes, allows for use as a sweeping (PicoVNA 108 only) or CW signal generator via either port.
*Actual practical limitation derives from display size and resolution and resulting plot scaling.		
**These features will be developed according to user demand and priority expressed in user feedback.		

Bias-Ts

Bias-Ts are often not provided, or available as costly extras, on other VNAs. Use the PicoVNA's built-in bias-Ts to provide a DC bias or test stimulus to active devices without the complexity and cost of external DC-blocks. The bias is supplied from external power supplies or test sources routed to the SMB connectors next to each VNA port.
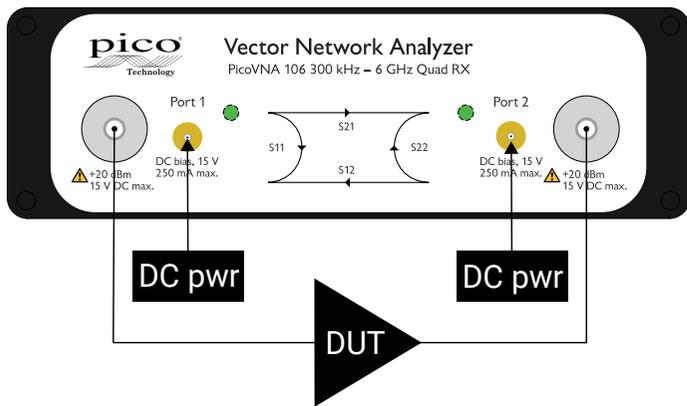

Use bias-Ts to power an active DUT

Other I/O

Power (12 to 15 V DC, 25 W) and USB 2.0 control are located on the rear panel. Trigger I/O for sweep synchronization and 10 MHz I/O for reference clock synchronization are available on four BNC sockets.

10 MHz reference in/out   *USB host connection*   *+12 V to +15 V DC power*

Power on/off switch   *Sweep trigger in/out*
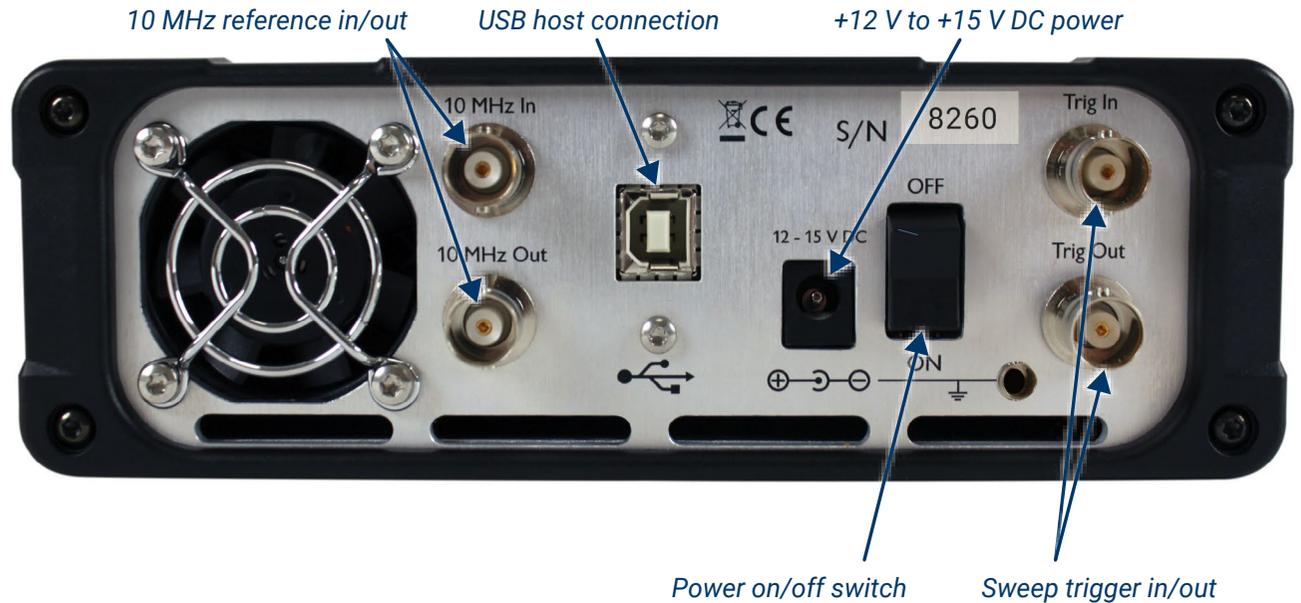

Test cables, adaptors, calibration standards and measurement check standards

A range of high-integrity RF and microwave accessories are available from Pico Technology. Test cables and calibration standards strongly influence the overall performance of a VNA, so we recommend that you select your accessories and perform your calibrations carefully.

Cables and standards are often the weakest links in a VNA measurement, generally contributing significantly to measurement uncertainty despite their traditionally high cost. At the lowest levels of uncertainty, costs can be significant and measurements can be compromised by seemingly quite minor damage or wear. For these reasons, many customers hold both premium-grade items for calibration, reference or measurement standards, and standard-grade items as working standards and cables. Pico Technology now offers cost-effective solutions in both grades. In general we recommend PC3.5 interfaces for premium or reference use and SMA interfaces for working use.

Phase- and amplitude-stable test leads and test port adaptors

Two test cable types and grades are recommended and provided by Pico Technology. Both of high quality, with robust and flexible construction and stainless steel connectors, the main differences between them are the provision of PC3.5 or SMA test ports and the stability of their propagation velocity and loss characteristic when flexed; that is, the degree to which a measurement could change when the cables are moved or formed to a new position. Cables are specified in terms of flatness and phase variation at up to 8.5 GHz when a straight cable is formed as one 360° turn around a 10 cm mandrel.

Order code		Grade	Dielectric	Diameter	Impedance	Loss	Phase stability	Amplitude stability	Length	Connectors
TA336		Standard	Low-density PTFE	7.1 mm (0.28") over jacket	50 Ω	0.7 dB at 6 GHz 0.85 dB at 8.5 GHz	2° at 6 GHz 2.8° at 8.5 GHz	0.1 dB at 6 GHz	600 mm	N(m)-SMA(m)
TA337		Standard								N(m)-SMA(f)
TA338		Premium		7.5 mm (0.30") over jacket		0.6 dB at 6 GHz 0.7 dB at 8.5 GHz	0.8° at 6 GHz 1.1° at 8.5 GHz	0.05 dB at 6 GHz		N(m)-PC3.5(m)
TA339		Premium								N(m)-PC3.5(f)

Order code		Grade	Name	Impedance	Bandwidth	Connectors*
TA342		Standard	ADA-STD-MM	50 Ω	18 GHz	SMA(m-m)
TA343		Standard	ADA-STD-FF			SMA(f-f)
TA357		Standard	ADA-STD-FM			SMA(f-m)
TA340		Premium	ADA-PREM-MM		27 GHz	PC3.5(m-m)
TA341		Premium	ADA-PREM-FF			PC3.5(f-f)
TA354		Premium	ADA-PREM-FM			PC3.5(f-m)

Calibration and measurement reference standards

Pico Technology offers a range of short, open, load and through (SOLT), 4-piece, 5-port manual calibration kits in male and female genders. All kits have high-performance, tight-tolerance stainless steel interface connectors and are supplied as an assembled five-port "Y" SOLT. They can be disassembled for individual usage, or for economical refurbishment should a calibration standard be damaged. Each SOLT is supplied with calibration data linked to the kit serial number.

Both the Standard and Premium kits offer exceptional residual directivity for the price. It is this that combines with good uncorrected port match on the PicoVNAs to deliver exceptional price-performance.

Premium PC3.5 kits are calibrated to reduced uncertainty using TRL intercomparison above 1.5 GHz.

* SMA, PC3.5 and K-type/2.92 connectors can all be mated with each other. SMA type has solid dielectric, PC3.5 has air dielectric.

Order code		Name	Type	Ports	Impedance	Connector*	Characterization*
TA344		SOLT-STD-M	Standard manual SOLT	5 (short, open, load, through)	50 Ω	SMA(m)	Full S-parameter 300 kHz to 8.5 GHz. Serial-numbered .kit file provided on USB memory stick.
TA345		SOLT-STD-F				SMA(f)	
TA346		SOLT-PREM-M	Premium manual SOLT			PC3.5(m)	
TA347		SOLT-PREM-F				PC3.5(f)	

Automated E-Cal USB-controlled and ovened calibration standards

Minimized as far as possible, the manual calibration process involves several torqued connect/disconnect operations and a manual loading of unique data files for each standard. The E-Cal SOLT calibration process reduces this to just one connection by internally switching its calibration standards. The process becomes automatic and highly repeatable, with power, control and data read all managed by the PicoVNA software over a USB interface.

Fast, convenient and less error-prone, an E-Cal standard is to an extent compromised by switch errors, resulting in non-ideal short, open, load and through. Mitigating this, the PicoVNA E-Cal standards include fast-rise oven control of device temperature, and seventeen traceable, full span s-parameters characterize the now stable imperfections. It is also true that the convenience, de-skilling and speed of automated calibration tend to promote more regular calibration, and thus more accurate, repeatable and reliable measurement – so much so that some process managers insist upon an automated E-Cal.

All PicoVNA calibration and check standards (below) are calibrated against fully traceable PC3.5 standards and are supplied in a protective carry case. Further specifications for the instrument and calibration kits can be found on later pages. We also offer a calibration service for Pico standards: see *Ordering information*.

| Order code		Name	Type	Ports	Standards	Impedance	Connector*	Characterization
TA518		SOLT-AUTO-M	Ovened USB-controlled automated E-Cal SOLT	2	Short, open, load, through and separate characterized/polarized port adaptor	50 Ω	SMA(m)	Full S-parameter 300 kHz to 8.5 GHz. Embedded and read from USB device
TA519		SOLT-AUTO-F					SMA(f)	

Check standards

We offer two economical check standards that can be used to validate the accuracy of a network analysis test setup and its calibration before and during or after measurements are made. Akin to the Beatty line, each check standard is a short length of mismatched line (75 mm of 25 Ω) with a predictable, smooth and stable mismatch and transmission characteristic that spans the frequency range of the PicoVNAs. These devices validate system measurement accuracy in the presence of high and varying mismatch and thus present a demanding validation on which to base confidence in a setup.

A comparison utility is provided in the PicoVNA 3 software (described on later pages) to evaluate the comparison against a combination of specified measurement uncertainties for the device, test leads and instrument. Each check standard is supplied with Touchstone measurement data on USB memory stick. The data is traceable via PC3.5 standards to national standards. The supplied Touchstone measurement data is compatible with, and can be used to manually validate a measurement of, any manufacturer's VNA.

Two check standards are available: insertable SMA(m-f) and noninsertable SMA(f-f).

Order code		Name	Type	Ports/Standards	Interface/Impedance	Characterization	Supported calibration modes
TA430		CHK-INS-MF Insertable with a male and a female port	Check standard	2 ports/ 25 Ω low-impedance line with transition to 50 Ω ports	SMA(m)/50 Ω	Full S-parameter 300 kHz to 8.5 GHz. Serial-numbered Touchstone file provided on USB memory stick	Insertable 12-term calibration, all S-parameters
TA431		CHK-NON-F Noninsertable with female ports			SMA(f)/50 Ω		Non-insertable, known and unknown through calibrations, all S-parameters

Please see *Software description* and *Specifications* for further details.

S-parameter and time-domain plots for TA431 over an 8.5 GHz span.
Minor but within-specification S$_{21}$ measurement errors present.

Test cables and calibration standards selection guide

Calibration kits can be purchased as a pair or as a single kit depending on the primary (best uncertainty) measurement application and its DUT interface, and sometimes to meet a secondary purpose with other DUT interfaces. Budget may also be a consideration. Pico Technology provides for all purchase options. You can order any combination of accessories, but to get you started we recommend that you choose one of the following 'universal' configurations.

Recommended configurations using manual SOLT calibration standards

For best overall test efficiency and uncertainty in a mix of single-port or dual-port test applications of both genders, we recommend these dual-port test lead and calibration standards configurations and the use of test port adaptors as necessary. All calibration modes are then available and where needed port adaptors can be fully included in the calibration.

Primary DUT interface	Select accessory grade	Required test leads	Required manual SOLT calibration kits	Supported measurement and calibration modes	Port adapt for some DUTs…
Universal capability. Dual-port devices or any single-port device with male or female or male and female ports	Standard SMA	1x TA336 SMA male port 1x TA337 SMA female port	1x TA344 SMA male ports 1x TA345 SMA female ports	All single and dual-port calibration modes and S-parameters	To address dual-port single-gender non-insertable devices, use and include within calibration 1x TA342 SMA(m-m) or TA343 SMA(f-f) test port adaptor.
	Premium PC3.5	1x TA338 PC3.5 male port 1x TA339 PC3.5 female port	1x TA346 PC3.5 male ports 1x TA347 PC3.5 female ports		To address dual-port single gender non-insertable devices, use and include within calibration 1x TA340 PC3.5(m-m) or TA341 PC3.5(f-f) test port adaptor.

The following configurations use just one SOLT calibration standard and are recommended where there is a focus on a particular port gender.

Primary DUT interface	Select accessory grade	Required test leads	Required manual SOLT calibration kits	Supported measurement and calibration modes	Port adapt for some DUTs…
Single port or dual-port noninsertable with female port(s)	Standard SMA	2x TA336 SMA male port*	1x TA345 SMA female ports	All S-parameters and all single and dual-port calibration modes except insertable	Note that mixed gender dual-port insertable devices can be addressed by adding and de-embedding 1x TA341 PC3.5(f-f) or TA343 SMA(f-f) test port adaptor**.
	Premium PC3.5	2x TA338 PC3.5 male port*	1x TA347 PC3.5 female ports		
Single port or dual-port noninsertable with male port(s)	Standard SMA	2x TA337 SMA female port*	1x TA344 SMA male ports		Note that mixed gender dual-port insertable devices can be addressed by adding and de-embedding 1x TA340 PC3.5(m-m) or TA343 SMA(m-m) test port adaptor**.
	Premium PC3.5	2x TA339 PC3.5 female port*	1x TA346 PC3.5 male ports		

* Can reduce to a single test lead in single-port measurement applications.

** With only one calibration kit it is not possible to calibrate after port gender adaptation. Purchase a second calibration kit of opposing gender for full calibration of a port adaptor. Alternatively, once a noninsertable calibration has been performed, it is possible to measure the port adaptor(s) and de-embed their error. A third option is to use reference plane shift and/or normalization for a lesser correction of adaptor errors.

Recommended configurations using automated E-Cal SOLT calibration standards

Primary DUT interface	Select accessory grade	Required test leads	Required manual calibration kits	Supported measurement and calibration modes	Also suited to DUTs...
Universal capability. Dual-port devices or any single-port device with male or female or male and female ports	Standard SMA test leads	2x TA336 SMA male port 2x TA343 SMA(f-f) port adaptor	1x TA518 SOLT-AUTO-M and 1x TA519 SOLT-AUTO-F*	All dual-port calibration modes and S-parameters	Use and include within calibration: 1) A test port adaptor to address insertable dual-port devices**. 2) Both port adaptors to address dual male port non-insertable devices.
	Premium PC3.5 test leads	2x TA338 PC3.5 male port 2x TA341 PC3.5(f-f) port adaptor			
Alternatively using 1x automated E-Cal calibration standard ...

Dual-port non-insertable devices or any single male port device	Standard SMA test leads	2x TA337 SMA female port 1x or 2x TA342 SMA(m-m) adaptor	1x TA518 SOLT-AUTO-M		Note that opposing gender dual-port non-insertable devices can be addressed by adding and de-embedding a further port adaptor.***
	Premium PC3.5 test leads	2x TA339 PC3.5 female port 1x or 2x TA342 SMA(m-m) adaptor			

* This automated dual E-Cal SOLT configuration is available with discount. Please see TA520 on the ordering information page.

** To calibrate use the characterized and polarized through adaptor supplied with your E-Cal standard. The PicoVNA E-Cal calibration wizard guides this setup.

*** With only one calibration kit it is not possible to calibrate after two-port gender adaptations. Purchase a second E-Cal calibration kit of opposing gender for full calibration after two-port adaptions. Alternatively, once a non-insertable calibration has been performed, it is possible to measure the second port adaptor and de-embed its error. A third option is to use reference plane shift and/or normalization for a lesser correction of adaptor errors.

6 GHz Network Metrology Training and Metrology Kits

The low-cost PicoVNA 106 opens up the potential for every student or trainee to learn through the use of a full-function professional-grade vector network analyzer. The Pico PQ186 Network Metrology Training Kit builds on this opportunity and supports a wide variety of learning and experiment. Central to the kit is the separately available PQ189 Network Test PCA. This printed circuit accessory hosts a variety of example lumped element, active and passive and transmission line DUTs and end-of-line SOLT (short-open-load and through) calibration standards.

Used with the PicoVNA 106 or 108, the kit supports teaching objectives around reflection and transmission measurements, S-parameters and other standard measurement quantities. These can be presented and interpreted as log, linear, phase, real, imaginary, polar and Smith chart formats and derived quantities group delay and time domain transmission and reflection. Additionally, by including an active broadband amplifier element (+5 V DC power required, 2.1 mm jack), nonlinear compression measurements such as P1dB and AM to PM (phase due to amplitude modulation) can be explored using the PicoVNA 106's built-in measurement utilities.

Measurements and calibrations are made via industry-standard SMA connectors. These support measurements out to 6 GHz and the teaching of best interconnection practice and the importance of secure, repeatable and robust connections. Using the on-board calibration standards the student can practice calibration for reflection, transmission and 8- and 12-term corrections using short-open-load and the known and unknown through methods.

Also included in the kit is a set of budget SMA(f) SOLT calibration standards (PQ190). With these the student can calibrate at cable ends rather than on board. This supports teaching and experiment around reference plane shift, normalization and the de-embedding of feedlines and connections on the PCA. Assumed 'ideal' and typical calibration data for these standards can be downloaded from picotech.com, along with the comprehensive user's and trainer's guide and referenced instrument settings files. Students with access to the AWR Design Environment can also download the Microwave Office design project for the kit PCA. Pico's Cadence AWR DE interface wizard can then import real-world measured data directly to the project to allow measurement enhanced simulation or comparison with the design simulations. Software development kit examples are also available via GitHub (github.com/picotech) to import and work with measured data in other CAD, test and programming environments such as MATLAB, LabVIEW, C, C#, C++ and Python.

The Pico PQ186 Network Metrology Training Kit includes N(m) to SMA(f) inter-series adaptors, SMA(m-m) test leads and fixed SMA wrenches – all that the student will need to pair with the PicoVNA 106 (or any other VNA) to begin their practical learning. Printed circuit layout of the network test PCA is generic to support modification to alternative passive network and components.

PCA includes example attenuator, broadband amplifier, 25 Ω mismatched line, resistive power divider, lowpass and bandpass filters and a user chip component site, plus short, open, load and through calibration elements.

Network Metrology Demonstrator Kits

Two Network Metrology Demonstrator Kits are also offered. These include Pico's now widely respected Standard SMA or Precision PC3.5 professional-grade test leads, a female SOLT calibration kit and an SMA non-insertable female-to-female Check Standard; both with reference data, traceable back to national standards. Either of these kits can realise and verify the full measurement capability and accuracy of the PicoVNA 106 or 108. High-quality, low-uncertainty measurements can then be made, suiting this training investment to much wider application within research and doctorate projects. Accurate measurement can also establish accurate reference and error terms in the measurements that students are making when using the PQ186 Network Metrology Training Kit.

PQ187

Order code	Description	Notes	USD*	EUR*	GBP*
PQ186	Network Metrology Training Kit and carry case	*Incl: PQ189 training PCA, PQ190 SMA(f) training SOLT kit, 2x N(m)-SMA(f) inter-series adaptor, 2x TA312 60 cm SMA(m-m) test lead, TA177 SMA wrench.*	889	759	629

Computer-aided design partners

Antenna matching with Optenni Lab CAD software
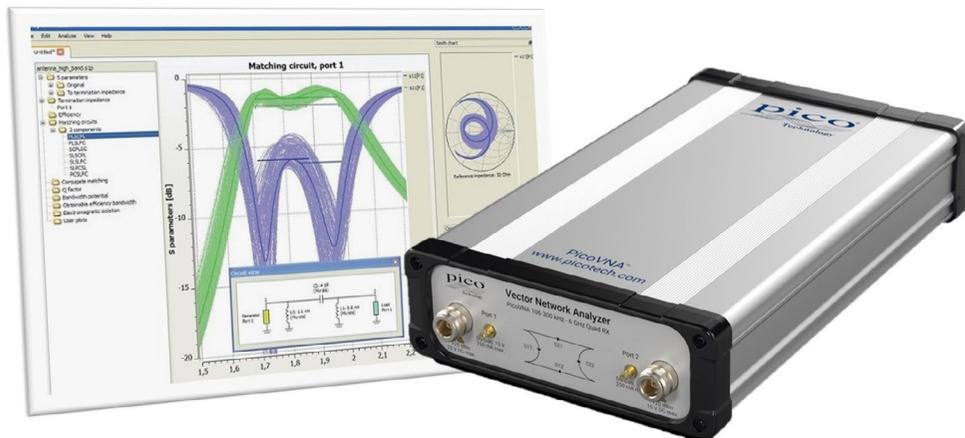

IoT, 5G, WiFi, V2X – has there ever been a bigger market explosion than the use of the antenna, and use within very challenging locations? Optenni Lab is industry-leading RF design automation software for antenna matching and RF chain performance optimization. The tool addresses multi-band, broadband, multi-antenna and tunable antenna systems and synthesizes measurement-based matching solutions in real time. In other words, Optenni Lab outputs optimized matching circuits based on live vector network analyzer measurements of antennas. Optenni Lab versions from 4.3 SP5 are compatible with the PicoVNA. The tool synthesizes optimal topologies from discrete, distributed, variable or switched component libraries against desired bandwidth and isolation targets, taking into account mutual coupling to nearby antennas. Optenni Lab automatically outputs highly complex and normally time-consuming designs. This CAD software interfaces the PicoVNA control DLL directly and no further software is required.

Cadence AWR Connected for PicoVNA

The AWR Connected wizard for the PicoVNA brings affordable vector network measurement right into the Cadence AWR Design Environment. Component, system and subsystem measurements are available, controllable and displayed inside your simulation workspace. Real-world measurements become available for one-click transfer directly to project data files – that you can use within your simulations or for direct plot and comparison.

Design–Simulate–Implement–Measure workflow is encapsulated in a single design environment, tightly coupled for optimized speed and efficiency.

Features at a glance

- Control and view PicoVNA output inside your design environment
- One-click measurement transfer to new or existing project data files or plots
- Fast, convenient comparison of ideal, modeled and measured component data
- Simulation with measured component or subsystem data
- Extend measured data to 0 Hz for passive component simulation at DC
- Measure and plot active max. stable gain, available gain, K-factor and B1

### Powerful education and training alliance

Can there be any more effective and rewarding learning experience than completing the whole design cycle? Unfortunately, the high costs of microwave network measurement have for many compromised that experience in the classroom. We believe that the more affordable PicoVNA 106 6 GHz full-function, professional-grade vector network analyzer, partnered with Microwave Office, changes the game.
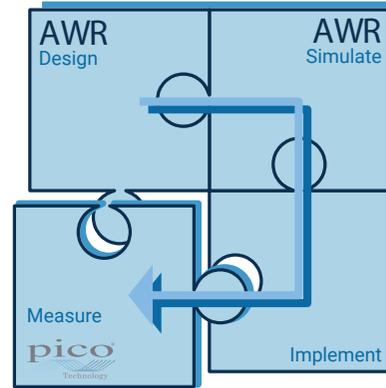

Designed within Microwave Office, the PCB project design file is available to download. Students and trainers can engage at any point in the design cycle, compare simulation with real measurement, and experiment within the simulated and real environments.

Microwave Office project file for the Network Metrology Test kit

How it works

1. Start the PicoVNA wizard to launch the PicoVNA control software and establish control of the PicoVNA.
2. From the **PicoVNA** tab select your saved calibration and measurement settings. Select single or dual port import and preferred preview plots.
3. Save Touchstone from here if required.

4. From the **MWO Datafile** tab, select or create a project data file to receive your measured data.
5. One click creates or updates your data.

6. Optionally use the **Passive Component** or Transistor data tabs to create or update parameter graph plots with one click.

Microwave Office layout with the PicoVNA wizard (2nd panel) in the workspace
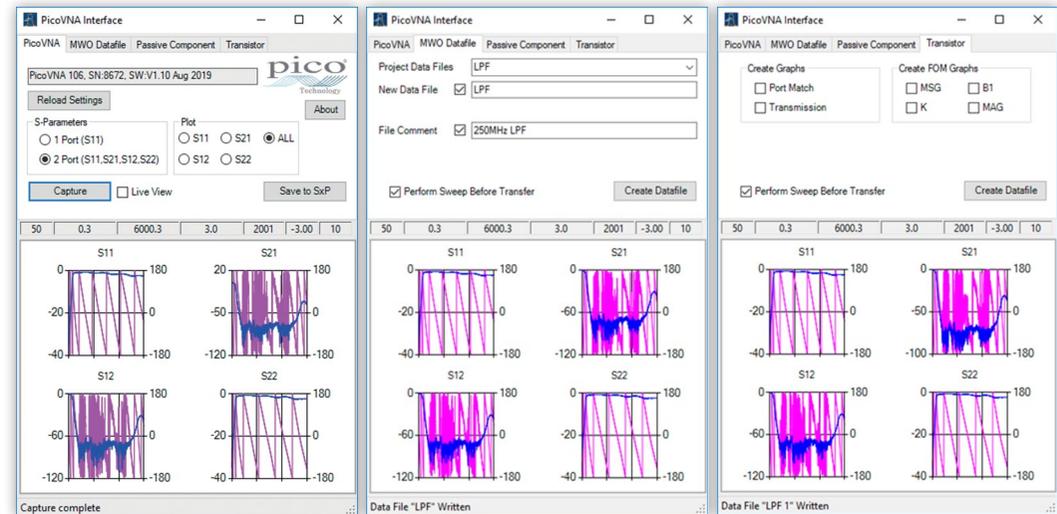

Reference plane extension

Reference plane extension (offset) allows you to shift the measurement reference plane away from the point established during calibration. This is useful in removing the path length of assumed ideal connectors, cables or microstrip lines from measurements. PicoVNA 3 software allows independent reference plane extensions on each of the measurement parameters (S_{11}, S_{22}, S_{12} or S_{21}), either as an automatic re-reference or by manual entry. Independent extensions allow, for example, different extensions on the two ports for S_{11} and S_{22} and then through-line normalization for S_{21} and S_{12} transmission comparison with equivalent length through-line.

After calibration ref plane is here

For the measurement we want the ref plane to be here

VNA

Actual device to be tested

DUT on microstrip test jig
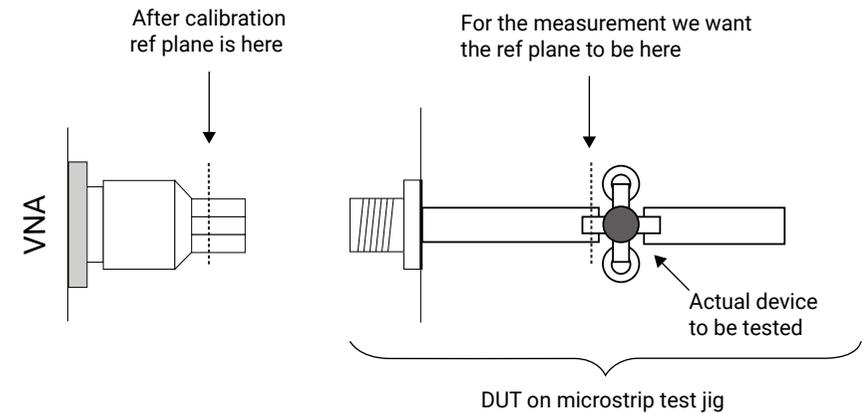

De-embedding embedded port interfaces

When it is unsafe to assume the above ideal interconnecting connectors cables or microstrip lines; for example to achieve greater accuracy or to remove known imperfections in a test setup, we can choose instead to de-embed the interface networks on each measurement port. The PicoVNA software simply requires a full Touchstone .s2p file for the embedded interfacing network on each port. Likewise, defined networks can be embedded into the measurement to achieve a desired simulated measurement. As for a calibration, best accuracy will be achieved when the embedding network is defined at the same frequency points as the intended measurement. Unusually for a vector network analyzer, the PicoVNA software will interpolate where necessary and possible.

Time-domain transmission and reflectometry measurements

Time-domain reflectometry is useful in the measurement of a transmission line or component; in particular the distance-to-fault location of any discontinuity due to connectors, damage or design error. To achieve this, the PicoVNA software determines from its frequency-domain measurements the time-domain response to a step input. Using a sweep of harmonically related frequencies, an inverse fast Fourier transform of reflected frequency data (S_{11}) gives the impulse response in the time domain. The impulse response is then integrated to give the step response. Reflected components of the step, occurring at measurable delays after excitation, indicate the type of discontinuity and (assuming a known velocity of propagation) the distance from the calibration plane.

A similar technique is used to derive a TDT (time-domain transmission) signal from the transmitted signal data (S_{21}). This can be used to measure the pulse response or transition time of amplifiers, filters and other networks.

The PicoVNA software supports Hanning and Kaiser−Bessel lowpass filtering on its time-domain IFFT conversions, preserving magnitude and phase, and achieving best resolution. Marker readouts include magnitude, time, distance and line impedance in ohms. A DC-coupled DUT is essential to the method. The 8.5 GHz bandwidth of the PicoVNA 108 supports time-domain pulse transition times down to 58.8 ps, with the PicoVNA 106 reaching 82.7 ps.
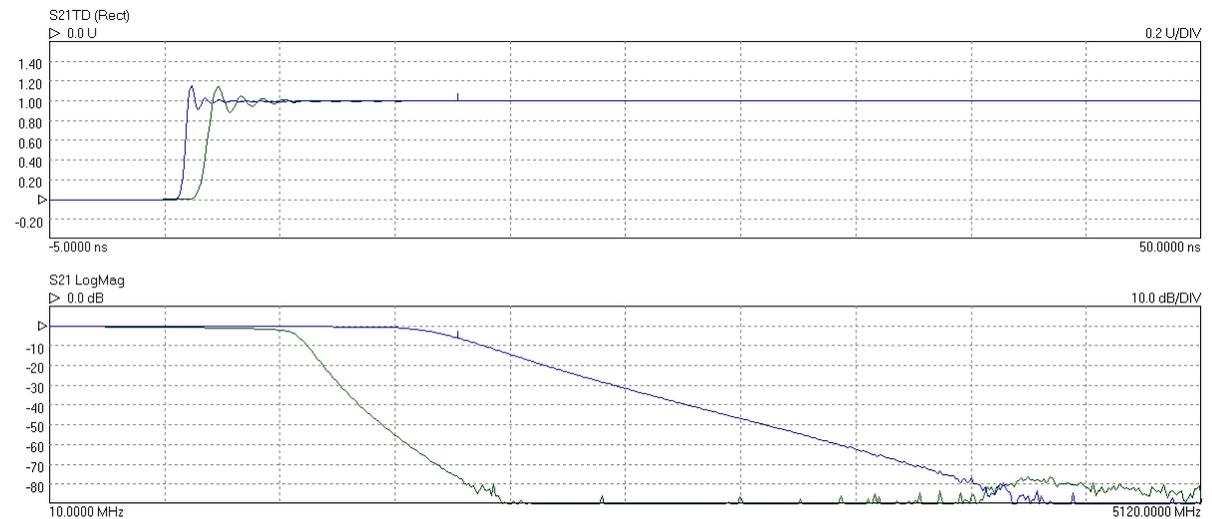

Time domain transmission step responses (top) and frequency responses (bottom) of two lowpass filters

Z₀ impedance reference

System measurement impedance (default 50 Ω) can be mathematically converted to any value between 10 Ω and 200 Ω. The PicoVNA software also supports the use of external matching pads and calibration in the new impedance using a calibration kit of that impedance.

Limit lines testing

The limit lines facility allows six segments to be defined for each displayed plot. These can be extended to 11 segments using an overlapping technique. Visual and audible alarms can be given when a limit line is crossed. All plot formats except Smith chart and polar support limit testing. Peak hold functions are also available.

Supported calibrations

The PicoVNA 3 software supports a comprehensive range of calibration modes to address single or dual-port workload with male, female or mixed gender interfaces, all with best achievable accuracy (least uncertainty). In some instances only a single calibration kit may be required, as has been outlined above.

As you would expect, the Pico calibration kits are individually serial-numbered and supplied with S-parameter data. This data is a traceable and accurate record of measured errors for the calibration kit. It can be loaded into the software, which will correct for these errors and those of the instrument during a calibration.

Alternatively, you can use a third-party calibration kit whose 'model', electrical length, parasitic values and polynomial coefficients you can enter into the software and then save in Pico .kit format. Where a third party has supplied a calibration kit S-parameter data file, please ask us about the possibility of conversion to Pico format.

When using an automated E-Cal SOLT Standard, an extended set of traceable S-parameter data sits within the device and is read directly into the PicoVNA software over its USB control and power connection.

As for any vector network analyzer, for best accuracy a calibration is performed before a measurement with the same sweep span and frequency steps as the measurement. If, however, a change of sweep settings is necessary for a measurement, the PicoVNA software will for convenience interpolate its corrections to the new sweep settings.

An *enhanced isolation* calibration setting is available for optimum dynamic range when using resolution bandwidths below about 1 kHz.

P1dB utility

The 1 dB gain compression point of amplifiers and other active devices can be measured using a power sweep, either at a test frequency or over a sweep of test frequencies. The VNA determines the small-signal gain of the amplifier at low input power, and then increases the power and notes the point at which the gain has fallen by 1 dB. This utility uses a second-order curve fit to determine interpolated 1 dB compression points.
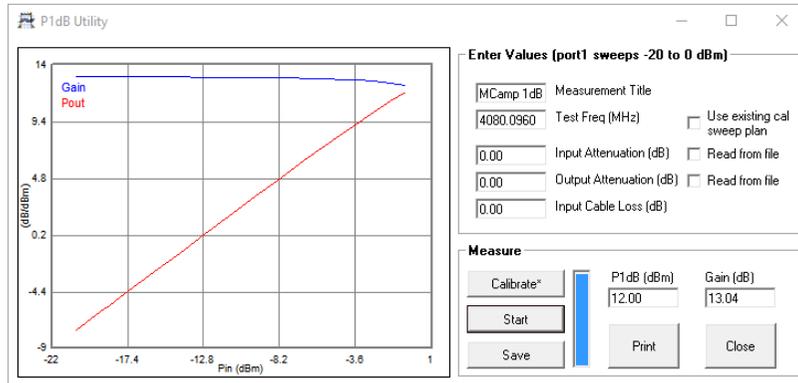

AM to PM conversion utility

AM to PM conversion is a form of signal distortion where changes in the amplitude of a signal produce corresponding changes in the phase of the signal. This type of distortion can have serious impact in digital modulation schemes for which amplitude varies and phase accuracy is important.
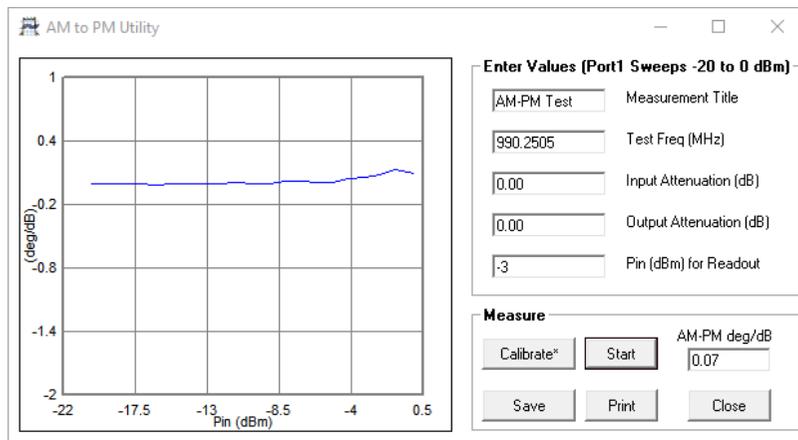

Phase meter utility (PicoVNA 108 only)

The phase meter adds a valuable phase and amplitude alignment and stability measurement capability to the PicoVNA 108. The two ports become auto-lock receivers at any user-specified frequency within the 300 kHz to 8.5 GHz tuning range of the VNA. The receivers will lock to externally applied signals within approximately ±70 kHz of the set frequency and begin to measure and cross-refer phase and amplitude of the two signals as numerical readouts.

Calibration and normalization facilities are provided, allowing, for example, precise alignment of a quadrature-phase relationship or determination of differential phase and amplitude balance or stability.

The IF bandwidth setting determines displayed result resolution, update rate and also measurement noise at any given signal level. At IFB of 10 Hz, resolution is 0.001° and 0.001 dB and update rate around 4 readings per second. Amplitude and phase accuracies match those of standard VNA transmission measurements.
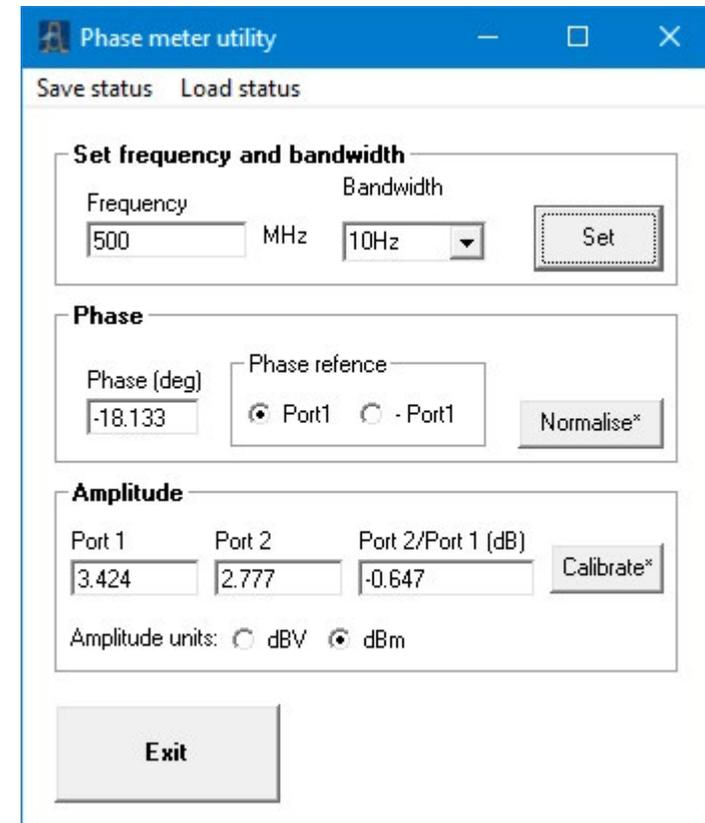

Save on trigger utility (PicoVNA 108 only)

Uniquely, benefiting from the fast measurement speed of the PicoVNA, save on trigger provides a fast and convenient method for capture and display of measurement data from multiple or changing device-under-test states. Think, for example, of variable attenuators, digitally configured filters, phase shifters or variable-gain amplifiers. Think also of devices under changing power supply, bias or environmental conditions, or even of a multiplexed measurement of a number of devices in the production environment. The PicoVNA can be set up to store up to 1024 triggered sweep measurements which can then be inspected, reordered and saved to disk in a number of formats. The trigger event can arrive on the external trigger input, or as a remote software trigger or a manual key press.

Captured measurement sweeps can be selected for display which, by default, shows one to four selected S-parameters across a maximum of 64 individually coloured traces, all plotted over the band of operation. The plotted sweeps can be any subset of all the captured sweeps and data can be normalized to one of the captured sweeps, which is useful for examining changes from sweep to sweep.

The plots to the right show S_{21} (magnitude and normalized magnitude in dB) for 16 states of a programmable step attenuator. The plot beneath and right plots S_{21} and S_{11} at a user-selected frequency of 986 MHz. Here the horizontal axis plots measurement sweep number, each in this case representing a unique state of the attenuator. All four S-parameters can be displayed simultaneously in this way on the graphs. Using a hardware external trigger and maximum resolution bandwidth, all the data for these plots was captured within 1 second!

The captured sweep data can be saved to disk in a number of formats, including Touchstone®, for use with third-party applications. Data can be saved grouped by S-parameter, for example. The file list on the right shows the files created for the stepping attenuator. You simply enter the name *Step_Attn* when saving the data, and the family of files shown is automatically created. In each of these files each column contains the S-parameter data for a given sweep. The first column after the frequency column contains data from the first sweep, the second has data from the second sweep and so on.

The data can also be saved for any single frequency within the sweep range used to capture the data. There is also an option to save the entire dataset for later use.

Capture and inspect multiple traces of one or multiple S-parameters. These are S21 plots for sixteen 1 dB increments of a step attenuator.

Mixer measurements utility (PicoVNA 108 only)

External local oscillator and external power sensor support

A wide range of mixer performance and port isolation measurements can be carried out, including swept RF or IF with a choice of low or high side LO. A PicoSource AS108 or a third-party signal source is used as the external LO source, and this operates under the control of the PicoVNA 3 PC application. The software also supports a third-party USB power sensor in the characterization of port power.

Supported USB-controlled signal sources	Supported USB-controlled power sensors
PicoSource® AS108	Agilent/Keysight U8480, U2000
MiniCircuits SSG-15G, SSG-6000, SSG-6001	Rohde & Schwarz NRP8S, NRP8SN, NRP18S
TTi TGR 6000	

Contact Pico if you'd like us to consider support for your choice of external USB signal generator or power sensor.

VSWR correction

Mixers can be difficult to measure accurately particularly when mixer port match is relatively poor. The PicoVNA 108 mixer measurement calibration includes the option of VSWR error correction. This reduces the conversion loss measurement uncertainty as typically shown in the diagram.
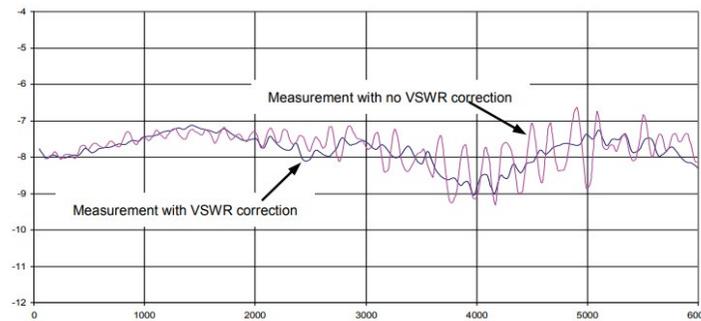

Mixer compression

Conversion loss change as a function of the input RF level is easily determined. This can be referenced either to the port power uncertainty of the PicoVNA, or you can use a third-party power sensor (above) to pre-characterize the PicoVNA 108 port power for enhanced accuracy. The 0.1 and 1 dB compression points are displayed on completion.
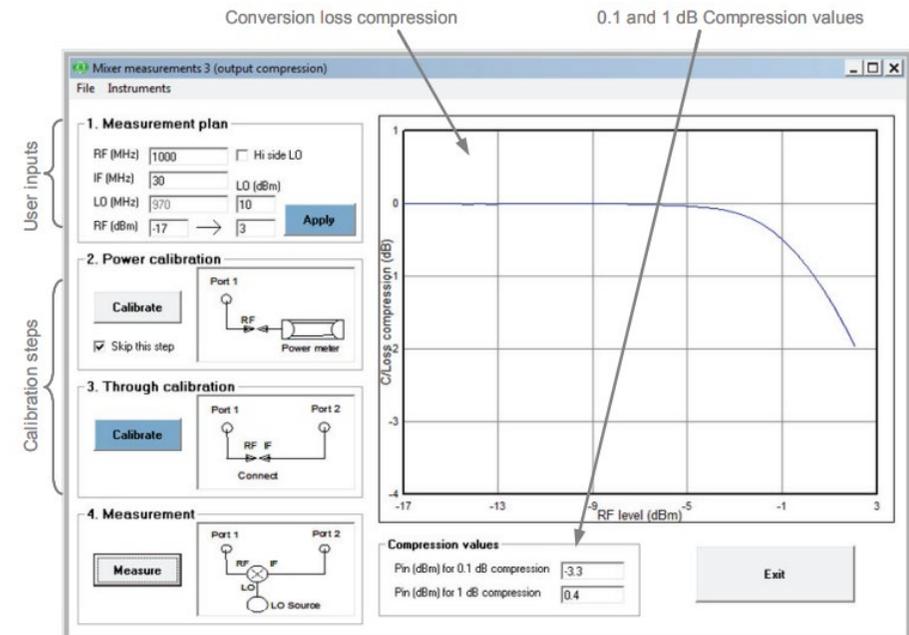

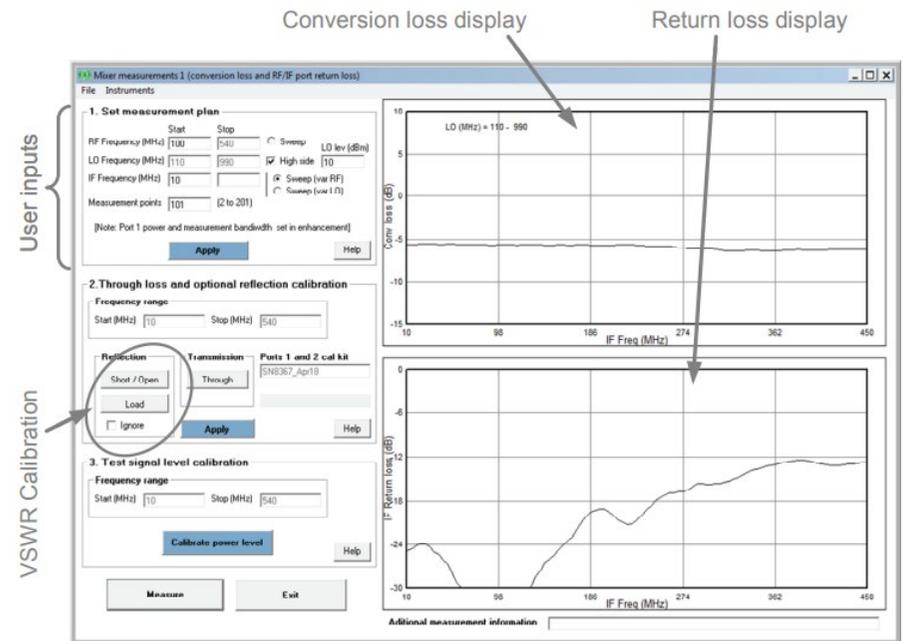

Check standard comparison utility

The supplied Touchstone measurement data for a serial-numbered check standard is loaded into the PicoVNA memory trace as a 'Reference' measurement.

With a valid, full S-parameter, full-span calibration established and the check standard connected between the test ports, the comparison utility performs a measurement. It then compares and tabulates, on each frequency point basis, the measurement with the stored 'Reference' data. Magnitude and phase difference are tabulated.

The utility combines uncertainties for the instrument and test leads (respective specifications) with measurement uncertainty and stability of the check standard (also supplied). The difference between reference and measurement is then compared with total uncertainty, giving a result of 'pass' (within uncertainty) or 'fail' (outside uncertainty).

You can save the comparison dataset for archive or analysis.
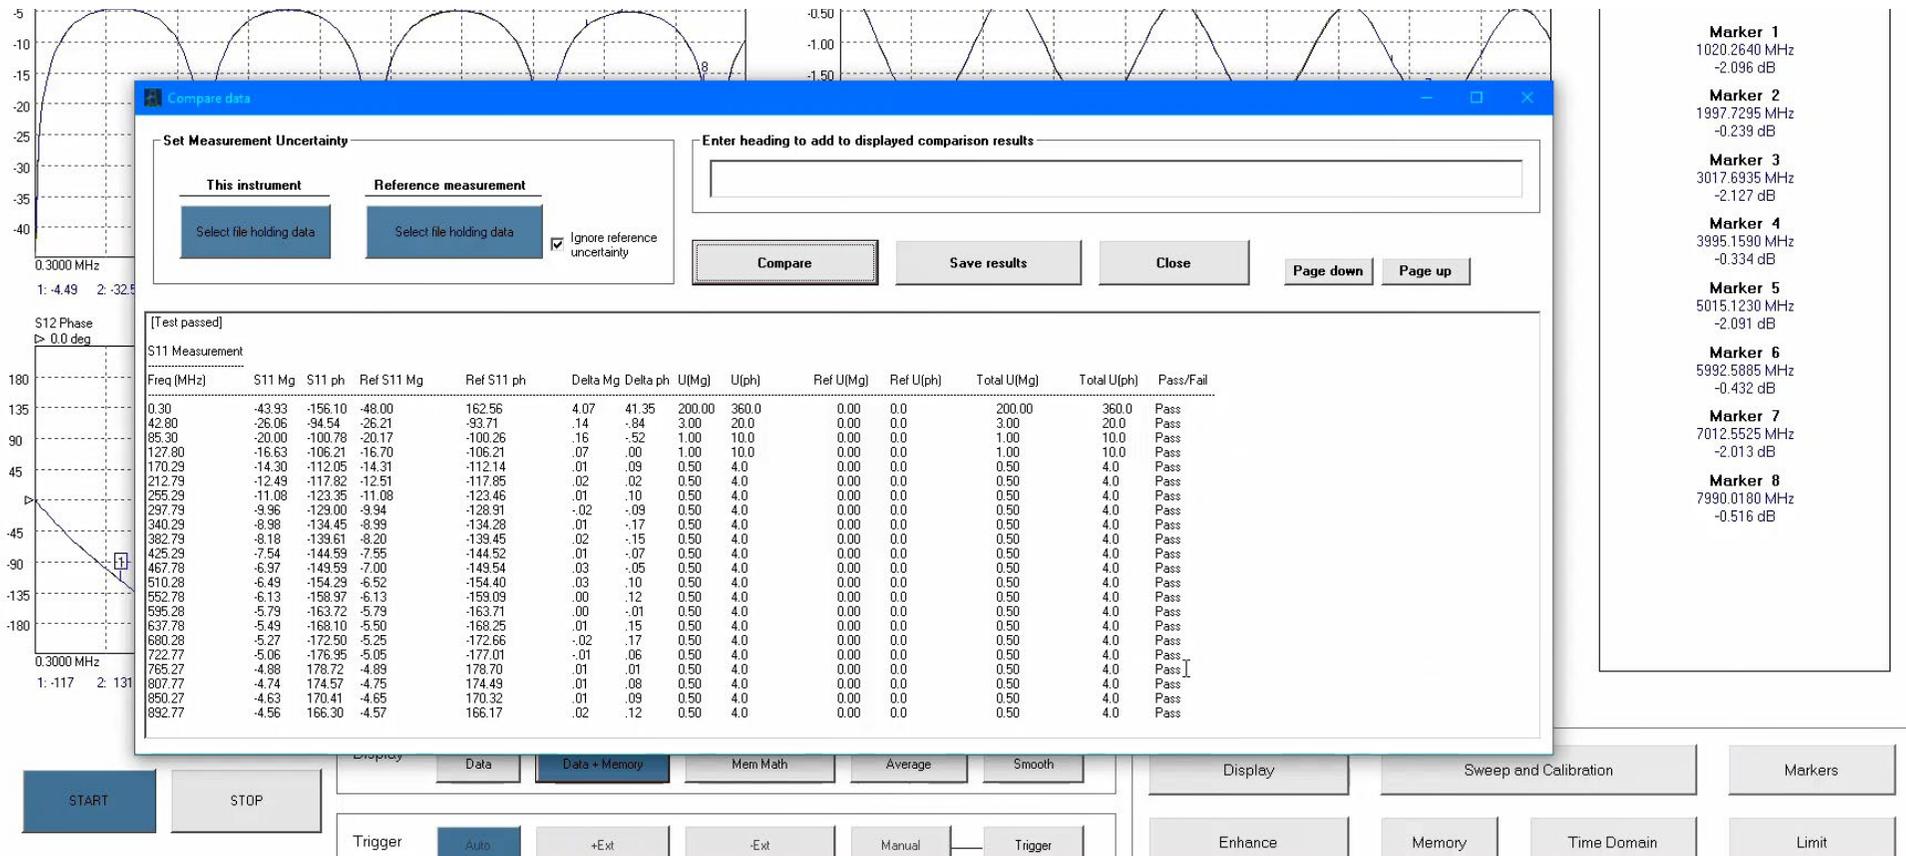

This is a very demanding evaluation of an instrument, test leads and the calibration performed, very nearly, to the full specification of the instrument and leads. The test is designed to identify a weak process, or worn, contaminated or damaged system components that might lead to a compromised measurement. To gain a pass, correct calibration procedure must be followed including the use of torque wrenches to make the connections at calibration and comparison measurements. The uncertainty data provided attempts to take into account the expected variability of your measurement setups when mating the check standard with Pico-supplied PC3.5 or SMA port connectors. There is a wide variation in the quality of commercially available test cables and SMA connectors, and contamination, damage or wear can easily occur. We guarantee that the uncertainty data provided will cover your test setups only when you use Pico-supplied calibration standards, port adaptors and test leads in new condition.

Specifications

Standard conditions: 10 Hz resolution bandwidth, at 13 dBm (PicoVNA 106) or 0 dBm (PicoVNA 108) test power, at an ambient temperature of between 20 °C and 30 °C but within 1°C of the calibration temperature and 60 minutes after power-up.

[6] PicoVNA 106 [8] PicoVNA 108

Test level of −3 dBm. No averaging. Bandwidth 10 Hz. Ambient temperature equal to the calibration temperature.

A 12 error term calibration is assumed carried out with a good-quality SMA or PC3.5 calibration kit capable of achieving the performance specified.

These values are supplied with our Check Standard on USB memory stick as uncertainty data file:

"Instrument Uncertainty with Pico Standard SMA leads 106.dat"
or:
"Instrument Uncertainty with Pico Standard SMA leads 108.dat"

Uncertainty files are installed with the software.

Spurious responses	−76 dBc typical, −70 dBc max.

The main spurious response occurs close to (2 x RF + 1.3) MHz or (3 x RF + 2.6), where RF is the test frequency in MHz. For example, when testing a bandpass filter with a centre frequency of 1900 MHz, an unwanted response will occur around 632.47 MHz or 949.35 MHz. In all known cases the levels will be as stated.

Test port characteristics

Load match	Corrected: 40 dB min. corrected, 46 dB, typ. Uncorrected: 16 dB (PicoVNA 106) or 15 dB (PicoVNA 108), typ.	
Source match	Corrected: 40 dB min. corrected, 46 dB, typ. Uncorrected: 16 dB (PicoVNA 106) or 15 dB (PicoVNA 108), typ.	
Directivity	40 dB min. corrected, 47 dB, typ. corrected	

Crosstalk	PicoVNA 106			PicoVNA 108			Corrected. Both calibrated ports terminated in short circuits. After isolation calibration.
	Band (MHz)	Typ. (dB)	Max. (dB)	Band (MHz)	Typ. (dB)	Max. (dB)	
	< 2	−100	−90	< 1	−100	−90	
	2 to 4000	−110	−90	2 to 6000	−110	−90	
	4000 to 6000	−100	−90	6000 to 8500	−100	−90	

Maximum input level	+10 dBm, typ.		0.1 dB compression
Maximum input level	+20 dBm	+23 dBm	No damage
Impedance	50 Ω		
Connectors	Type N, female		

Bias-T input characteristics

Maximum current and DC voltage	250 mA, ±15 V
Current protection	Built-in resettable fuse
DC port connectors	SMB(m)

Sweep I/O characteristics		
Sweep trigger output voltage	Low: 0 V to 0.8 V. High: 2.2 V to 3.6 V.	
Sweep trigger input voltage	Low: −0.1 V to 1 V. High: 2.0 V to 4 V.	
Sweep trigger input voltage	±6 V	No damage
Sweep trigger in/out connectors	BNC female on back panel	
Measuring functions		
Measuring parameters	S_{11}, S_{21}, S_{22}, S_{12} P1dB (1 dB gain compression) AM to PM conversion factor (PM due to AM) Mixer conversion loss, return loss, isolation and compression (PicoVNA 108 only)	
Error correction	12 error term full S-parameter correction (insertable DUT) 12 error term full S-parameter correction (noninsertable DUT) 8 error term full S-parameter unknown through correction (noninsertable DUT) S_{11} (1-port correction) De-embed (2 embedding networks may be specified) Impedance conversion S_{21} (normalize, normalize + isolation) S_{21} (source match correction + normalize + isolation) Averaging, smoothing Hanning and Kaiser−Bessel filtering on time-domain measurements Electrical length compensation (manual or auto) Effective dielectric constant correction	
Display channels	4 channels	
Traces	Up to 4 live traces, two plot parameters and/or plot axis scalings per display channel	
Display formats	Amplitude (logarithmic and linear), phase, group delay, VSWR, real, imaginary, Smith chart, polar, time domain	
Memory trace	Up to 4 memory traces per display channel	
Limit lines	6 segments on one trace, per channel (overlap allowed)	
Markers	8 markers	
Marker functions	Normal, Δ marker, fixed marker, peak/min. hold, 3 dB and 6 dB bandwidth	

Sweep functions

Sweep type	Linear frequency sweep, CW time-based sweep, and power sweep (P1dB utility)	

Sweep times		

Bandwidth	S_{11}, S_{21}, S_{11}+S_{21} calibration	Full 12 or 8 term calibration
140 kHz	19 ms[1]	37 ms[1]
10 kHz	37 ms	72 ms
1 kHz	0.21 s	0.42 s
100 Hz	1.94 s	3.87 s
10 Hz	19.2 s	38.4 s
LF Adder (for each low frequency point < 2.5 MHz)	1.25 ms/pt	2.5 ms/pt

[1] 20 ms and 38 ms for PicoVNA 108

10 MHz to 6 or 8.5 GHz, 201-point trace length. For other lengths and bandwidths the sweep time is approximately:

$$T_{SWP}(s) = N \times (T_{MIN} + F_{BW} / R_{BW})$$

where:

N = number of frequency points
$T_{MIN}(s)$ = minimum time / point (s2p: 167 µs; s1p: 85 µs)
F_{BW} = bandwidth settle factor (s2p: 1.91; s1p: 0.956)
R_{BW} = resolution bandwidth (Hz)

For sweep repetition period, add software rearm time:

T_{ARM} = average 6.5 ms or worst case 50 ms

For markers on, increase T_{ARM} by 39 ms

Number of sweep points, VNA mode	51, 101, 201, 401, 801, 1001, 2001, 4001, 5001, 6001, 7001, 8001, 9001, 10 001
Number of sweep points, TD mode	512, 1024, 2048, 4096

Signal source characteristics

	PicoVNA 106	PicoVNA 108	
Frequency range	300 kHz to 6.0 GHz	300 kHz to 8.5 GHz	
Frequency setting resolution	10 Hz		
Frequency accuracy	10 ppm max		With ambient of 23 ±3 °C
Frequency temperature stability	±0.5 ppm/°C max		Over the range +15 °C to +35 °C
Harmonics	−20 dBc max		With test power set to < −3 dBm
Non-harmonic spurious	−40 dBc typical		
Phase noise (10 kHz offset)	0.3 MHz to 1 GHz: −90 dBc/Hz 1 GHz to 4 GHz: −80 dBc/Hz > 4 GHz: −76 dBc/Hz		
Test signal power	< 10 MHz: −3 to −20 dBm 10 MHz to 4 GHz: +6 to −20 dBm > 4 GHz: +3 to −20 dBm	≤ 6 GHz: +10 dBm to −20 dBm > 6 GHz + 6 dBm to −20 dBm	
Power setting resolution	0.1 dB		
Power setting accuracy	±1.5 dB		
Reference input frequency	10 MHz ±6 ppm		
Reference input level	0 ±3 dBm		
Reference output level	0 ±3 dBm		

Manual calibration kits

Load uncorrected return loss	≤ 3 GHz > 3 GHz	≥ 30 dB ≥ 27 dB	≥ 30 dB ≥ 26 dB	≥ 30 dB ≥ 26 dB	≥ 28 dB ≥ 26 dB	
Load corrected return loss	≤ 3 GHz > 3 GHz	≥ 46 dB ≥ 43 dB	≥ 46 dB ≥ 43 dB	≥ 40 dB ≥ 37 dB	≥ 40 dB ≥ 37 dB	Inferred from directivity after applying correction using measured data provided with the kit
Open circuit return loss	≤ 3 GHz > 3 GHz		≤ 0.15 dB ≤ 0.2 dB			
Short circuit return loss	≤ 3 GHz > 3 GHz		≤ 0.2 dB ≤ 0.25 dB			
Through adaptor insertion loss	≤ 6 GHz	≤ 0.15 dB	≤ 0.15 dB	≤ 0.15 dB	≤ 0.2 dB	
Transfer calibration method	300 kHz to 1.5 GHz 1.5 GHz to 6 GHz	SOLT comparison TRL comparison		SOLT comparison		SOLT = short, open, load, through TRL = through, reflect, line

Automated E-Cal kits

Port interface and impedance	2x 50 Ω SMA(f) ports	
Port input limits	+10 dBm operating, +20 dBm/1 V pk protection	
Bandwidth	300 kHz to 8.5 GHz	
Directivity	40 dB	
Source match	40 dB	
Load match	36 dB	
Reflection tracking	0.05 dB	
Transmission tracking	0.04 dB	
Transfer calibration method	SOLT comparison	Characterization data records to internal memory
Control and power	USB 2.0 (micro)	
Dimensions	65 mm L x 43 mm W x 15 mm H	Including connectors and feet
Weight	60 g	
Temperature (operating)	5 °C to 40 °C	
Temperature (oven control range)	+18 °C to 28 °C	To meet quoted accuracy
Oven warming time	45 s typical at 23 °C	
Humidity (operating)	5% to 80% RH non-condensing	
Temperature (storage)	−20 °C to 50 °C	
Humidity (storage)	5% to 80% RH non-condensing	

Check standards

Devices	Bandwidth	Return loss	Insertion loss	
TA430 CHK-INS-MF insertable TA431 CHK-NON-F noninsertable	0.3 to 8500 MHz	< −30 dB to > −6 dB	> −0.2 dB to < −1.9 dB	Formed by 75 mm of 25 Ω mismatched line

Reference uncertainty	Reflection			Transmission		
	Freq. range	Level range	Mag. / phase	Level range	Mag. / phase	
	< 2 MHz	−15 dB to 0 dB	0.99 dB / 11.3°	0 dB to +6 dB	0.57 dB / 8.5°	Ambient temperature 20 °C to 26 °C
	> 2 MHz		0.71 dB / 5.7°		0.28 dB / 2.8°	
	< 2 MHz	−25 dB to −15 dB	1.13 dB / 14.1°	−40 dB to 0 dB	0.42 dB / 2.8°	These values are supplied with our Check Standard on USB memory stick as uncertainty data file:
	> 2 MHz		1.41 dB / 8.5°		0.14 dB / 1.4°	
	< 2 MHz	−30 dB to −25 dB	4.24 dB / 28.3°	−60 dB to −40 dB	0.71 dB / 11.3°	"Check Standard Reference Measurement Uncertainty.dat".
	> 2 MHz		3.54 dB / 21.2°		0.42 dB / 5.7°	
	< 2 MHz			−80 dB to −60 dB	2.83 dB / 21.2°	The software installs the two uncertainty files.
	> 2 MHz				2.12 dB / 17.0°	

Note: The Pico TA430 and TA431 check standards can be used in the performance verification of the PicoVNA but they have too much uncertainty to make a confident verification to the full performance specification of the instrument. Nonetheless, the uncertainty of the verification, given in the result from the compare utility, may be low enough for the application. If sufficient, the use of either TA430 or TA431, of course, significantly reduces ownership costs and increases the regularity with which a verification can be made.

Miscellaneous

	PicoVNA 106	PicoVNA 108	
Controlling PC data interface	USB 2.0		
Support for third party test software	Dynamic Link Library (DLL) as part of user interface software		
External dimensions	286 mm L x 174 mm W x 61 mm H		Including connectors and feet
Weight	1.85 kg	1.9 kg	
Temperature range (operating)	5 °C to 40 °C		
Temperature range (storage)	−20 °C to +50 °C		
Humidity	80% max, non-condensing		
Vibration (storage)	0.5 g, 5 Hz to 300 Hz		
Power supply voltage	+12 to +15 V DC		
Power consumption	22 W	25 W	
Power source connector	5.5 mm diameter hole, 2.1 mm diameter centre contact pin. Centre pin is positive.		
Controller (PicoVNA 3)	Microsoft Windows 7, 8 or 10 (32- and 64-bit)		
Controller (PicoVNA 5)	Windows 8, 10 and 11 (64-bit), macOS 11 (and later), Linux		
Safety	Conforms to EN 61010-1:2019 and EN 61010-2-030:2010		
Warranty	3 years
